

peak brightness. Furthermore, we got an sRGB coverage of 98.8 percent which is very good, paired with a DCI-P3 coverage of 75.3 percent. Paired with the 16:10 ratio display and the specs on-board, the Slim 5i makes for a solid editing and rendering device.

PERFORMANCE

The Lenovo Legion 5i Slim features the latest 13th gen Intel Core i7-13700H,

world gaming performance. The Gigabyte Aorus 15 manages to outperform the Lenovo Legion 5i in most titles save one or two.

Despite having identical specs, the Gigabyte Aorus 15 offers better FPS in the majority of the titles. This most likely has to do with the fact that the Aorus 15 handles heat better and doesn't throttle as much as the Legion Slim 5i. The difference isn't very big, at

Both laptops features speedy M.2 NVMe SSDs for storage that will more than suffice for your gaming and productivity needs.

THERMALS AND NOISE

The centre of the laptop can get a bit toasty when running intensive tasks. As we've seen from the performance scores, there is throttle due to heat which is affecting performance. We saw surface temps north of 41 degrees in the centre region of the laptop. It's just the centre though, the rest of the laptop remains at comfortable temps at around the 25-26 degree mark. Note that we test in an air conditioned environment, so the temps might differ depending on your environment.

VERDICT

We personally really like the Lenovo Legion Slim 5's aesthetics and overall look. The accompanying display is also great with great resolution, sRGB coverage, and a high refresh rate.

The specs on-board are also great, with a combination of the 13th gen Intel Core i7-13700H, 32GB of DDR5-5200 RAM, and the NVIDIA GeForce RTX 4070. However, compared to the similarly specced Gigabyte Aorus 15 (which has slower RAM) the Lenovo Legion Slim 5i actually underperforms. While it's not by much and most likely won't be noticed in everyday use, the Legion Slim 5i does run hotter and throttles a lot more than the Aorus 15 in comparison. Ultimately, the hardware still performs within the expected margins, and the results are still good, but you could get better for cheaper.

—Manish Rajesh

SPECIFICATIONS

Processor: Intel Core i7-13700H | GPU: NVIDIA GeForce RTX 4070 | TGP: 140W | Display: 16-inch, 2560x1600 IPS display, 240 Hz | RAM: 32GB DDR5-5200 | Storage: 1TB M.2 NVMe SSD, 2 slots

AGENT 001's thoughts

"The Slim 5i may look sleek and professional, but it packs a gaming punch under the hood. With impressive specs and a sharp display, it's ready for both work and play. However, it faces some heat in the gaming arena when compared to its rivals, so choose wisely if you're in the market for a slim gaming laptop."

which is paired with an NVIDIA RTX 4070 with a TGP of 140W. For this review, we're comparing it with the similarly specced Gigabyte Aorus 15 which we tested very recently. Both laptops feature the same CPU and GPU with the same TGP. The only major difference is the RAM; while the Legion 5i Slim we're testing came with 32GB of DDR5-5200 RAM, the Aorus 15 came with 16GB of DDR5-4800 RAM. Both laptops feature similar slim profile builds as well.

Let's start things off with the synthetic gaming benchmarks for which we use the 3DMark benchmark.

The scores are very similar across the board, but the Aorus 15 does seem to have the Legion Slim 5i beat in more tests overall.

There's a more distinguishable difference in performance between the two laptops when we come to real-

roughly ~10 FPS, but it does matter if you consider that the Legion Slim 5i is the more expensive of the two laptops.

With that we come to the processor and productivity benchmarks. Similar to gaming performance, we see that the Aorus 15 once again manages to inch-ahead of the Lenovo Legion Slim 5i. The difference once again is small, but it's noticeable.

This continues with single-thread and multi-thread performance as well, which we test using the Cinebench R23 benchmark. Again, not very big a difference, but noticeable nonetheless.

Both laptops come with DDR5 RAM, but the DDR5-5200 RAM on the Legion Slim 5i is definitely faster than the DDR5-4800 RAM on the Aorus 15. However, the faster RAM doesn't seem to have helped the Legion Slim 5i get an advantage over the Aorus 15 in terms of performance.
