

came out to be around a very impressive 545.3nits. The good things don't just end there because the 13.5-inch IPS LCD panel is also highly colour accurate with a Delta E value of just 2. Additionally, the screen also has 107% sRGB coverage so if you're a graphic designer, video editor or if you largely create content for the web then the HP Dragonfly G4's display will serve you well.

And the same good things I will say about the laptop's speakers as well because they sound fantastic. They have good bass, treble and are loud enough so that you rarely even find the need to turn the volume to its maximum. The laptop has both upward and downward-firing speakers.

BATTERY LIFE AND PERFORMANCE

In a real-world scenario with 100% screen brightness and the laptop's battery set to performance mode, the Dragonfly G4 will last you around 7.5 hours. With a more moderate power and screen brightness setting you can further stretch the battery life. Overall, the battery life is above average as the HP Envy x360 15 I recently tested lasted close to 6.5 hours. And most Windows laptops in general rarely cross the 7-hour battery mark in general. So the 7.5 hours of battery that you get on the HP Dragonfly G4 is really better than most other laptops.

The high battery life is also a result of a combination of using LPDDR5 RAM and the Intel "U" series chip. The 32GB Low Powered Double Data Rate 5 or LPDDR5 for short has an even less operating voltage than the DDR5 sticks and an incredible clock speed of 6400MHz. And as for the Intel Core i7-1365U chip, I was initially a bit sceptical about it. But seeing it perform without throttling issues really did change my mind.

Because you have to rethink the 13.5-inch form factor when it comes to the HP Dragonfly G4. Not only is it a thin and light laptop but a highly premium one at that. Any executive using

it can't expect its fans to spin at max speed just to it could deliver more performance. The laptop needs to run cool and as a result, the 1365U consumes, at its peak, just 20W. While fairly dipping down to 19 or 18W as well. This performance setup does its job of regulating surface temperatures too. The peak

it. It is a bit pricey and although performance enthusiasts could argue that an Intel "H" series chip would suit better here or even a "P" series chip that performs duties in the Samsung Galaxy Book3 series would be much preferable here, I'd like to argue that, for the type of workloads expected from

Boo-Man's thoughts

"Ah, the HP Dragonfly G4, same old suit, but a tech-boost within. But is it worth that hefty price tag? Well, it's like wearing a fancy tuxedo to grab a coffee. Sure, it looks good, but do you really need all that in a laptop?"

surface temperature remains around 35 degrees in a non-AC room with no external ventilation.

VERDICT

The HP Dragonfly G4 is the successor to the Dragonfly G3, and while it retains much of the external design of its predecessor, it introduces significant internal advancements. This high-end premium laptop is powered by the Intel vPro platform, specifically designed for business PCs, enhancing both security and remote management. This makes the Dragonfly G4 particularly suited for global executives who are always on the move. It boasts comprehensive security features and collaboration tools.

The laptop's main strength includes its solid build quality, a fantastic keyboard and trackpad combo, comprehensive privacy features, power-efficient SoC, hardware-level security features and rich speakers ultimately making the Rs 2.3 lakh HP Dragonfly G4 worth

this laptop, the "U" series chip seems better right now. However, you'd expect these laptops to last more than two years and considering that at least an Intel "P" series processor should have been here. Other than that the laptop is pretty good. I'd also suggest that you take a look at Dell's Latitude series as it is pretty similar in terms of price and feature set compared to the HP Dragonfly G4.
