

Boo-Man, however, wasn't ready to surrender just yet. "Fine, let's assume someone up there wants to read our magazine. How are we even going to distribute it? Are we going to launch paper copies into the void and hope someone catches them?" Agent001's eyes sparkled with excitement. "Nah, Boo-Man, we'd go digital! We'll set up a satellite network to broadcast our content across the solar system. High-speed interplanetary Wi-Fi, anyone?"

Gangsta Granny chuckled. "Yo, that's what I'm talkin' about! Even aliens gotta binge-watch their space shows and read reviews on their space tablets, right?" As they discussed their distribution plans, I couldn't help but get drawn into their wild idea. It was like a blend of Arthur Dent's bewildering adventures and Elon Musk's ambitious SpaceX missions. Boo-Man scratched his head. "Alright, let's say, against all odds, we pull this off. What's the magazine gonna be called? 'Digit in the Stars'? 'Tech Warp'? 'CosmoGizmo'?"

Agent001 grinned wider. "Nah, Boo-Man, we need something epic, something that resonates with the cosmic spirit. How about 'Technotronics'?" Gangsta Granny nodded approvingly. "Yeah, 'Technotronics' got that space swag, fam!"

Their brainstorming session was like a fusion of Arthur C. Clarke's profound titles and the wordplay of Piers Anthony's Xanth series.

Boo-Man finally relented, a hint of reluctant amusement in his eyes. "Alright, 'Technotronics' it is. But I have one more question – who's gonna be the first tech reviewer in space? Are we drawing straws for that, or do we have an actual plan?" Agent001 looked thoughtful. "I think we should have a contest, open to our readers. They can submit essays on why they should be the first 'Technotronics' reviewer in space. We'll pick the most passionate, tech-savvy, and entertaining entry." Gangsta Granny grinned mischievously. "And I'll be the judge, yo! I know a tech guru when I

see one, and I'll make sure they bring that cosmic flavour to their reviews!"

Their plan was like a blend of Gene Roddenberry's vision of a better future and the quirky competition of Roald Dahl's Willy Wonka. As I continued to eavesdrop on their whimsical conversation, I couldn't help but admire their audacious dream. It was like a blend of the wonders of space exploration and the playful imagination of a child's bedtime story.

In that dingy corner of the Digit office, amid piles of gadgets and tech magazines, Boo-Man, Agent001, and Gangsta Granny had embarked on a journey that seemed both improbable and fantastical. And while the world might scoff at their idea today, who knows? Tomorrow, we might be flipping through the pages of "Technotronics," the first tech magazine in space, floating among the stars and galaxies, one cosmic gadget review at a time. The trio continued to brainstorm, delving into the nitty-gritty of their space magazine venture. Gangsta Granny suggested they could have a regular column dedicated to decoding alien technology, with a catchy title like "Extraterrestrial Tech-talk." Boo-Man, surprisingly, had a moment of enthusiasm and proposed a section called "Tech Debunked," where he could debunk space myths and pseudo-scientific claims.

Agent001, ever the optimist, pointed out that space tourism was on the rise, and they could collaborate with space hotels to provide in-room copies of "Technotronics." "Imagine," he said, "a luxurious stay on the Moon with our magazine waiting for guests, filled with reviews of moon buggies and lunar spa gadgets!" Their plans seemed like a blend of Philip K. Dick's mind-bending technology and the futuristic luxury resorts depicted in Arthur C. Clarke's novels. Boo-Man then raised a practical concern. "What about the competition? Are we the only ones crazy enough to launch a tech magazine in space? What if

some Martian startup beats us to it?" Agent001 reassured him. "We'll be the pioneers, Boo-Man. Besides, our content will be out of this world! We'll have zero-gravity cooking shows, holographic product reviews, and AI interviews with spacefaring celebrities. No one can match that!" Gangsta Granny added, "Yo, we'll be trendsetters in the Milky Way, fam!"

Their determination was like a blend of Robert A. Heinlein's pioneering spirit and the fearless innovation of Elon Musk.

As their plans continued to unfold, I couldn't help but be swept away by their enthusiasm. It was like witnessing the birth of a new era in tech journalism, a blend of futuristic ambition and irreverent humour.

Boo-Man, Agent001, and Gangsta Granny had transformed their absurd idea into a grand vision. They imagined a future where "Technotronics" would be the go-to source for all things tech in the cosmos. Their journey was like a blend of Jules Verne's adventurous spirit and the imaginative world-building of Frank Herbert's Dune.

But with great ambition came great challenges, and they knew they had a long road ahead. They discussed the intricacies of financing their space venture, the logistics of building a space-proof magazine, and the complexities of interstellar copyright laws. As they delved into the legalities, I couldn't help but think of the works of Isaac Asimov and his explorations of futuristic bureaucracy and space law.

Hours passed, and their conversation remained as lively and absurd as ever. It was a fascinating blend of science fiction dreams and real-world problem-solving. I marvelled at their determination, their willingness to take a leap of faith into the cosmos, and their unwavering belief in the power of technology to bridge the gap between Earth and the stars. d
