

Baby steps

The admirable backplate was the first thing that I took off the GPU. And, you might call me a nerd, but the PCB looked gorgeous. Seeing a GPU's PCB after a long time brought back so many memories. You can get an idea of how the cooling system is on this bad boy!

Flippin it!

I flipped the card around and took off the colling assembly. The process was tough, but I managed. As you can see, I got so caught up in taking the cooling assembly apart that I forgot to take pictures. The thermal compound would give you an idea of the arrangement of the GPU die and other transistors inside the card.

The holy grail!

The card from the insides looked as beautiful as I had imagined it to be! The GPU die called out my name, and I rushed to inspect it closely.

Final looks

This is when Mithun joined in and admired the glory of the 4060Ti GPU die with me. A part of me died when the realisation hit that I hadn't seen a GPU die like this in so long. The memory modules were arranged to perfection! I know there is a lot of engineering that goes behind, and not just art. But, for me it was like a beautiful painting that I would pay all my wealth for.

Turn back time

After putting the GPU back together, thankfully without breaking anything, I got to the power pins. For hardware that is as powerful as this RTX 4060Ti, I was surprised that it did not require an external PSU to power it. This was in comparison to the days when my GPU used up tons of power and produced enough heat to raise the temperature of my room by a degree or two.
