

GAMING LAPTOPS UNDER ₹60,000: WHAT TO BUY?

A guide to help you pick your budget gaming machine during this sale season

By Yetnesh "MuscleMan28" Dubey | feedback@skoar.in

Massive online discounts are upon us, and for many, this is the perfect time to buy a gaming laptop under Rs 60,000. So what are the features one should look for before buying a gaming laptop under Rs 60,000? Well, the information below is to help you find exactly that answer. I have explained all the important factors that affect your buying decision, ranging from the choice of the GPU and CPU to how much storage you should look for and what upgradability options are at your disposal. These

points are specific to the Rs 60,000 price range, as I will discuss the laptop components that are most commonly found in this price segment.

GPU

Within the Rs 60,000 price bracket in India, there are several GPU options for gaming laptops. But before diving into them, it's essential to understand two significant factors – VRAM and TGP. VRAM or Virtual RAM or Virtual memory is the amount of memory a GPU has. The more it is, the better because the GPU will have the ability

to load more textures, pixels, and other graphical data related to video games. For example, you cannot play Doom Eternal at ultra graphics preset on a GPU which has 4GB VRAM but you can play the game at medium graphics preset with the same GPU. That's because the ultra graphics preset needs to show more textures and sharper pixels that require more VRAM in the GPU for storage. However, most gaming laptop GPUs available in the Rs 60,000 price range are limited to just 4GB GDDR6 VRAM.

On the other hand, TGP stands for Total Graphics Power. In layman's terms, it represents the maximum power a laptop or desktop GPU can utilize. Generally, higher TGP is preferable unless comparing GPUs from different generations. For instance, an NVIDIA GeForce RTX 3050 with 90W TGP might offer fewer FPS in games than an NVIDIA GeForce RTX 4050 with 60W TGP. But when comparing an RTX 4050 with 60W TGP to one with 80W TGP, the latter promises better gaming performance, assuming other laptop components are up to par.

To find out the TGP of a gaming laptop's GPU, especially one under Rs 60,000, the NVIDIA control panel is a handy tool. After updating to the latest NVIDIA driver, navigate to "Help" in the NVIDIA control panel, followed by "System Information." This section provides a comprehensive overview of your GPU, including its power limit. Another approach is to access the system information window in the NVIDIA control panel, where Ampere laptops' TGP details are available. However, it's crucial to remember that the GPU TGP displayed might not always be precise, so cross-checking with other resources or the manufacturer's specifications is always a good practice. Considering the factors of VRAM and TGP, the gaming laptop GPUs available in the gaming laptop under Rs 60,000 price range include:

- NVIDIA GeForce GTX 1650
- NVIDIA GeForce RTX 2050
