

Plus have USB 2.0 speeds), and much more. The charging speed, however, has remained the same at 25W. In our 0-100 charging test, the iPhone 15 Pro took an hour and 27 minutes (87 minutes) to charge from 0 – 100 percent.

The battery of the iPhone 15 Pro is bad. With everything online about the new iPhone 15 series, battery is also one of the issues, and with good reason. The battery on the iPhone 15 Pro doesn't last as much. While on paper, we have a slightly bigger 3274mAh battery and a 3nm chip, which should technically be better, but that is not the case. At least not always. For example, on an average the iPhone 15 Pro is giving me more than 5 hours of on-screen time. However, there are days when the Apple iPhone 15 Pro has also given me more than 9.5 hours of on-screen time.

While my personal experience has been a bit of a hit and miss, in the battery tests also, the iPhone 15 Pro didn't show any impressive results. While gaming it lost 4 percent of its battery in a 15 minute Call of Duty: Mobile session. GPS navigation for 1 hour took up 9 percent of the battery, and in the video loop test, I was able to drain the smartphone's battery in just 6 hours! This is one of the lowest times in the recent battery tests I have done on smartphones this year.

CAMERA

Like I said, this is my first iPhone review and the first time I have experienced a "Pro" iPhone. Needless to say, this is a different level of camera experience. Like many of our prominent reviewer friends have said, the "Pro" in Apple iPhones is mostly directed towards the camera. As I write this review after using the iPhone 15 Pro for about two weeks, I'm still not done playing around with this camera.

Before I get into it, let us get the specs out of the way. This year, we are seeing a slightly bigger primary 48-megapixel shooter, a 12-megapixel ultrawide angle shooter which also acts as the macro lens, and a 12-megapixel telephoto lens. Now, the upgrade isn't as

major in the hardware department, but in terms of software, there are a lot of new things.

Firstly, all images from the iPhone 15 Pro's primary shooter are 2x pixel binned, instead of the 4x binning we saw in the previous iPhone 14 Pro models. This means that by default, the smartphone puts out 24-megapixel images. It does so by clicking a full 48MP image and a 4x binned 12MP image and then combining them to create a 24MP image. Not only this, the new Image Signal Processor enables you to click images faster, and it also enables the automatic portrait feature on the new iPhones, where it will automatically take a portrait if it detects a single subject in a frame. You can also go back and forth between using the image as a portrait or using it as a normal photo.

The photos from this camera are very good. Photos are detailed, they have a very good dynamic range, and represent colour quite accurately. Like all iPhone cameras, the photos from this are more true-to-life. Furthermore, photos from the wide angle and telephoto lens also remain consistent, meaning they are as good as the ones from the primary shooter.

In low light, the iPhone performs well. Both photos and videos are very good. However, in some cases, you will get light flare in and around light sources. Portraits, like always, are one of the best on any smartphone. I also used 3x optical zoom quite a lot since of course, we get iPhone photos with optical zoom. Like there is enough to make you want to be more creative.

The iPhone 15 Pro also has other features to play around with. For example, the cinematic mode and action mode are two of the things that I find myself using quite often when I want stable, cinematic footage of something. This year, the video capabilities on the iPhone Pro models have gone a step ahead towards being "Pro."

This year, we can shoot videos in a log mode, which basically gets rid of all software enhancements that Apple has in place, giving creators

proper raw footage that they can easily play around with. Pair that with USB type-C's ability to record and save and process data on a drive, and you can very well guess why this is as "Pro" as a device can get for creators.

VERDICT

So overall, the biggest upgrade on iPhones since maybe the last three years. For me, this is the biggest update since maybe USB type-C became a thing. And this is also the first time I am reviewing the iPhone, so the experience is kind of overwhelming. I want to talk about everything in way more detail than a few words allow and while it's time to end this review, I am left thinking if I have even touched upon everything.

Apart from the charm that the Apple iPhone holds, this launched with some very serious issues. Durability, battery, heating, design, there are many issues with the new iPhone 15 Pro. However, it also solves the longest-standing problem with iPhones, and brings an end to the long-standing alert slider in favour of the rather useful action button. The cameras, as usual, are superior to everything out there in terms of the video capabilities and compatibility. So yes, overall the iPhone 15 Pro is one of the most important iPhone upgrades of all time but if you are an iPhone user, the upgrade only makes sense if you're using an iPhone 12 series or older.
