

# LG UltraPC

Good laptop that gets the basics wrong

₹99,740

**A**s you may have understood from the “LG UltraPC Review” heading, the LG UltraPC is a complicated machine. Sure it has good build quality, a nice tactile keyboard, and a portable design, all of which highlight its great qualities. However, it lags behind in several key areas. And it really is a missed opportunity because premium thin and light laptops like the LG UltraPC

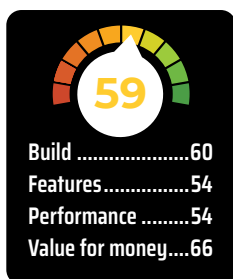

are a rare sight in the under Rs 1 lakh price category in India.

For the uninitiated, LG laptops’ portfolio in India consists mainly of the Gram series, primarily known for their super sleek design and lightweight. The laptops in this series are usually powered by Intel processors. However, LG has another series of laptops powered by AMD processors known as the UltraPC. And today, we’re taking a look at the LG UltraPC featuring an AMD Ryzen 7000 series APU. The laptop becomes a point of interest mainly because of that. Let me explain.

## LAPTOP DESIGN, BUILD QUALITY, KEYBOARD AND I/O

While writing this this LG UltraPC Review I’d be remiss if I didn’t talk about the laptop’s robust design typical of LG. Usually for slim and big laptops, that are bigger than 15 inches, the chassis flex is a common problem. But the LG UltraPC contains these flex very well. And LG accomplishes this by keeping the material premium. As a result, the device exudes both robust and luxurious vibes.

The full-size keyboard is also pretty fantastic. Usually in a thin and light

laptop, key travel is quite less but over here they feel pretty satisfying to click. The keys are square in shape and are spaced apart generously and the keyboard still has enough area left for accommodating a numpad. The touchpad is also bigger than average and leaves enough room on its top and bottom to prevent any mistouches. It has a very smooth surface and works quite well.

My only complaint here is in regard to the fit and finish of the trackpad. It is not leveled and its right side seems to be pushed more inwards compared to the trackpad’s left side. Moving on with my complaints I’d also like to mention that the keyboard has no backlighting. Yes! In 2023, LG chose to ship their laptop with a feature that’s ubiquitous in literally every other device in every price range. What’s the reasoning behind it, I have no idea. But the keyboard has no backlighting so you cannot use it in a dark room.

As difficult as it is to wrap our minds around the problem I mentioned, let’s talk about the rest of the laptop. Speaking of which it comes with a solid hinge that seems like it’d withstand the test of time. Moreover, the laptop’s lid also has a

premium finish and features an LG logo, the only branding on the UltraPC to speak of. So in terms of build quality and robustness, the LG UltraPC scores highly but a few totally alien decisions do reduce the laptop’s value.

In terms of I/O, I am happy to say that the LG UltraPC delivers. It features an HDMI slot, a USB Type-C superspeed port, a headphone and mic combo jack, two USB Type-A superspeed ports, an SD card slot, and a docking port. The USB Type-C port doesn’t mention itself as a lighting port, because it is a proprietary tech related to Intel. But you can still charge the laptop using a USB type-C cable. My only complaint here is that they should have given another Type-C

super speed port on the laptop so you can use it for faster data charging while charging using a Type-C cable.

## SCREEN AND SPEAKERS REVIEW

Following the modern trend, LG outfitted its laptop with a 16:10 aspect ratio display, a key highlight in the LG UltraPC Review. As a result, it has a 1200p maximum resolution compared to the normal 1080p resolution usually seen in the standard 16:9 displays. But the real difference you’ll actually notice is that the screen now has more height. This is really good as now you fit more stuff into it including more editing timelines, sheets, documents, etc.

In terms of specifications though, the screen is kind of a hit-and-miss. Sure, it has an anti-reflective coating and around 340 nits of peak brightness making it suitable for use in indoor conditions where there’s a lot of light. But the screen is not colour-accurate at all. It doesn’t even have 100% sRGB colour space coverage, which is again something quite common in many laptop’s nowadays.

The speakers too are pretty average. They aren’t going to blow you away in any way and are barely loud enough to be used in an outdoor environment. But they are viable for indoor usage though but I’d still
