

OPPO Find N3 Flip

Outclasses the market leader's cameras and battery life

Merely 7 months after the launch of the debutant OPPO Flip phone in India, the company has come up with a refresh – the OPPO Find N3 Flip. The phone largely stays the same as its predecessor in many areas, but there are three key areas where it gets upgrades. However, with the upgrades, OPPO stands a chance to disrupt the position of the market leaders in this category. Is the OPPO Find N3 Flip successful in doing that? Let's find out.

BUILD AND DESIGN

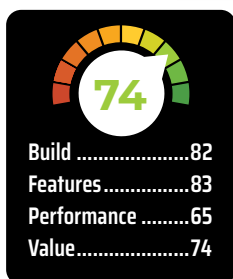

The OPPO Find N3 Flip nearly replicates the looks of its predecessor save for the camera module. The phone's thickness has gone up though – possibly to incorporate the triple camera setup. You've got an aluminium frame with a glossy rear panel made of glass.

The cover display is protected by Gorilla Glass Victus, which should make it pretty resistant to drops and scratches. The glossy body catches fingerprints and smudge marks pretty quickly and it is also very slippery when held or placed on a smooth surface. So, you'd probably be better off using the phone with a case that OPPO has bundled in the box.

The camera module's design language has been completely altered. The triple cameras now sit in a circular camera module that features a silver metal rim around it, which looks quite stylish, in my opinion.

The sides of the device are glossy as well, and once again, attract fingerprints and smudges galore. The buttons are nice and tactile, but the power button, which also doubles as a capacitive fingerprint sensor gets triggered incessantly causing the device to lock me out of using it until I enter the PIN. Not kidding, this happened

₹94,999

to me almost every. single. time. *sigh*

The left side houses an ALERT SLIDER! It has made its way over from OnePlus phones to OPPO devices and I love how convenient it is.

As a whole, I quite like how the OPPO Find N3 Flip looks.

However, there are definitely some misses such as the power button/fingerprint sensor fiasco and the lack of an IP rating. The Samsung Galaxy Z Flip5, on the other hand, comes with an IPX8 rating, which obviously means more peace of mind.

DISPLAY(S)

Let's talk about the displays. Well, there's actually nothing much new to say since not a lot has changed. They even have the same rated peak brightness levels of 1,600 nits. The cover display is also unchanged.

The inner display has thick bezels, as foldables usually do, but they are slightly thicker than the Samsung Galaxy Z Flip5. What's more important though is the crease, and it is barely visible on the OPPO

Find N3 Flip. The 'Flexion' hinge on the Find N3 Flip really makes a difference. The Samsung Galaxy Z Fold5's crease straight up looks like a relic compared to this one. The screen is rated for a whopping 6,00,000 folds but only time will tell if this rating can be trusted *cough cough* Moto Razr 40 Ultra *cough*.

The displays on the phone are pretty good though – colour consistency is great and content watched on the displays looks vivid. I recorded a peak brightness of 1,282 nits on the inner display under direct sunlight, while the cover screen gave about 702 nits. Decent, but not great for those days when there's harsh sunlight outdoors.

HDR10+ is supported on the inner display since you can only watch content when the phone is unfolded. It worked when I tried it on YouTube and Netflix. Alas, the fast refresh rate doesn't make it onto the cover screen, so it is a bit jarring when you switch from the inner screen.

Speaking of Mini apps, the cover screen on the OPPO Find N3 Flip is pretty useful. You get full-fledged support for 40+ apps. They apps are fully functional on the cover screen. Since the cover screen mimics the aspect ratio of regular screens, there are no weird distortions or black bars. Additionally, OPPO has even provided a full qwerty keyboard for you to type on. Very nifty.

Unfortunately, though, some things just don't work on the cover display including any video-playing apps (no flak here, understandable) or the Dialer app (for some strange reason?). In contrast, the Galaxy Z Flip5 can operate almost any app on the cover screen with Good Lock.

The transitions on the screens when folded and unfolded are also slightly jittery; I hope OPPO smoothes this out with a future OTA update. Additionally, there is no app continuity across the folded and unfolded state.

CAMERAS

The OPPO Find N3 Flip is the only flip smartphone in the market to feature a triple camera setup with none of this 2-megapixel depth/macro camera baloney. Instead, you've got what I believe is a flagship-grade triple camera array. This gives all the current-gen Flip smartphones
