

for complaints when it comes to performance, at least for the kind of equipment it's packing. Speaking of which, the Acer Aspire 5 gets 8GB LPDDR5 RAM running in dual-channel mode. Without going into the details, you can get the benefits of dual-channel memory in a single-channel stick if it's the latest DDR5 or LPDDR5 RAM type. But I still think that Acer could have gone with the former type because the latter is non-upgradable. So you're stuck with whatever RAM configuration you choose.

In my day-to-day usage, I found the 8GB RAM to be enough. But I don't edit videos, nor do I use Photoshop. So if your workflow involves either these or an even heavier workload then go for more RAM. But considering that the Acer Aspire 5 is a mainstream laptop with an Intel Core i5-1335U series processor, why would you use it for these tasks anyways. Still, Chrome tabs can be scary, so my personal advice is to choose a variant with at least 16GB LPDDR5 RAM.

The Intel 13th Gen Core i5-1335U is also a slight improvement over its predecessor in terms of a higher boost clock at 4.6GHz instead of 4.4GHz. Moreover, the new also has better Multi-core and single-core performance compared to the previous gen. In terms of Iris Xe Graphics too there is a small performance uptick. Combine all that with the improved efficiency of the 1335U and the result is stellar mid-range laptop performance.

In terms of storage, the Acer Aspire 5 comes with a PCIe Gen 3 512GB SSD. Although there are PCIe Gen 4 SSDs you don't need them unless your workload involves huge files. All in all, the 512GB SSD is comparable to other laptops in this price segment and works well.

As for the 8GB LPDDR5 RAM, I compared it with the 16GB LPDDR4 memory, and here are the results. The Infinix X3 Slim with 16GB LPDDR4 RAM and the Acer Aspire 5 with 8GB LPDDR5 RAM present distinct memory performance metrics. For Memory Read speeds, the Infinix X3 Slim registers at 59,456 MB/s, which is notably higher than the Acer Aspire 5's 48,571 MB/s. However, when it comes to Memory Write speeds, the Acer

Aspire 5 outperforms the Infinix X3 Slim with a score of 71,378 MB/s compared to Infinix's 66,604 MB/s. In the Memory Copy test, the Infinix X3 Slim again leads with a score of 60,315 MB/s, while the Acer Aspire 5 lags slightly behind at 56,442 MB/s. Lastly, in terms of Memory Latency, the Infinix X3 Slim has a slightly higher latency of 114.7 ns compared to the Acer Aspire 5's more efficient 106.6 ns. In summary, while the Infinix X3 Slim demonstrates superior read and copy speeds in MB/s, the Acer Aspire 5 excels in write speeds in MB/s and offers better latency.

CONCLUSION

The Acer Aspire 5, positioned as a potential best laptop under Rs 60,000, stands out in the crowded mid-range laptop market, striking a harmonious balance between performance and cost-effectiveness. A closer examination of its features reveals a commendable build quality. The fusion of a metallic lid with a polycarbonate deck not only ensures durability but also exudes a refined aesthetic appeal. Its minimalist design, further enhanced by the dual-tone grey and black polycarbonate bezels, radiates sophistication. Acer's branding, though present, is discreetly integrated, preserving the laptop's elegant facade.

In the performance arena, the Intel 13th Gen Core i5-1335U processor, boasting a boost clock of 4.6GHz, promises brisk multitasking and adept management of routine tasks. The inclusion of 8GB LPDDR5 RAM, albeit fixed, provides a notable speed edge, especially when juxtaposed against the Infinix X3 Slim's 16GB LPDDR4 RAM. The write speeds and latency metrics of the Acer Aspire 5 stand out, catering perfectly to users who often grapple with large file transfers or operate memory-heavy applications.

The display, however, is the Acer Aspire 5's weak link. A rather dim peak brightness of 182 nits coupled with a Delta E value of 12.4 suggests that the screen may falter in color-critical tasks like graphic designing or photo editing. The restricted sRGB and DCI-P3 color

gamuts further underscore this limitation. Although the 15.6-inch dimension and the anti-glare feature earn points, visual professionals might find the display wanting.

The laptop's I/O capabilities shine, especially with the integration of a Thunderbolt 4 port, an HDMI 2.1 outlet (capable of driving a 4K display at 120FPS), and a USB 3.2 interface. This array of ports equips the laptop to handle diverse connectivity scenarios, from presentations to dual-monitor configurations and rapid data transfers.

Special accolades are due for the keyboard and trackpad. The expansive keyboard, complete with a numpad, offers a tactile experience with satisfactory key travel, appeasing both casual users and those engrossed in data entry tasks. The trackpad, with its impeccable symmetry and construction, is a pleasant anomaly in this price bracket, though its endurance over extended use is yet to be ascertained.

To sum it up, the Acer Aspire 5 presents a spectrum of highs and lows. While it shines in areas like build, I/O provisions, and memory prowess, the display emerges as its primary shortcoming. It's tailored for corporate professionals, academia, and the everyday user. Yet, creatives seeking a display with color precision might need to scout elsewhere. The laptop, while offering value, does come with its set of trade-offs. Prospective buyers are advised to ponder over these nuances before committing.
