

LG TONE Free fit TF7

TWS that sound great, fit well, and tick most of the boxes

LG has been one of the biggest names in the consumer electronics market in India. In terms of audio products, LG has made a name for itself by keeping ahead of the curve in terms of innovation. They were one of the first mainstream brands to include a UV light-based cleaning system in their earbuds. This trend has continued in their latest product, the LG TONE Free fit TF7, which made its way into the Digit Test Centre some time back.

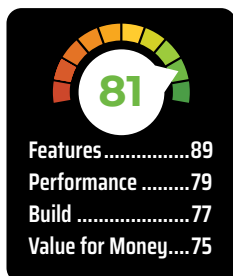

I tested the LG TONE Free fit TF7 by using them as my daily drivers and putting them through our rigorous testing process, and found out that the buds make a compelling case for themselves in a very unique way. Read my review of the LG TONE Free fit TF7 to find out how they fared in my testing.

BUILD AND DESIGN

The first thing that stood out to me when I unboxed the LG TONE Free fit TF7 was their case design and shape. The brand has gone with a very unique oval design when you look at the top cross-section of the earbuds and when looking at the side cross-section of the case, you get a flat bottom with an oval shape in the rest of the case. Now, this design, while it made it easy to slide the case in and out of my pocket, it added a LOT of bulk to the case.

Now, the heftiness of the case can also be attributed to the inclusion of the UVnano tech, which is the name given to their UV light-based cleaning system. However, I personally feel that a smaller case with the omission of the UVnano tech should be the way

₹12,989

to go. When buying TWS earbuds, the pocketability of the case is something that people definitely look for. With these earbuds, considering how everything else was, it would be great to see the brand go the tiny case route.

As for the buds, they sport a stem-less design, and fit really well in almost all ear types. I passed around these earbuds between my friends and folks at the Digit Test Centre, and with the different combinations of the silicon wings and the ear tips which are included in the box, the buds fit well in almost everyone's ears. Honestly, these are one of the only pairs of stem-less earbuds that I would personally consider using on a daily basis, thanks to their fit.

The materials used on both the case and the buds are solid and did not pick up any scuffs and scratches over the two weeks I used them. I am known to be someone who does put my tech through its paces when it comes to their durability, and the fact that there was not a

single scratch after I was done testing these earbuds, meant that things were headed on the right path here.

There is a dual-tone design on the case, with the exterior boasting a blueish-grey colour and the insides, a bright-lime colour. On the buds, you get the same colour as the exterior of the case, with the lime green colour making an appearance in the form of an accent ring on the buds.

Overall, there is not much to complain about here. Only a smaller case would be better, and I can see LG making improvements to this with their upcoming buds. Now, let's move on to the features.

FEATURES

One of the first things that you think of, when you look at the LG TONE Free Fit TF7 is the sport aesthetic that makes the positioning of these earbuds very clear. These are meant to be the buds for the people who have an active lifestyle and it is very clear from the get-go. So, the first thing that I looked at was their IP rating. These earbuds come with an IP rating of IP67, which means that you running during the rains should not be an issue.

The voice commands using Siri worked well for me, and the in-ear detection was one of the best I have seen in a pair of non-Apple earbuds. For context, I daily drive an iPhone, and the in-ear detection on many earbuds, which Apple does not make, does not work well on my phone.

As for the ANC, it worked like a charm on my train rides. It drained out all the rumbling sounds and gave me a nice music-listening and calling experience overall. Talking about ANC, the feature that goes hand in hand with noise cancellation is the transparency mode. The dual microphone setup on the earbuds for ANC and transparency modes works wonderfully.

Fast pair on Android devices also worked like a breeze, with there being absolutely zero instances of the feature glitching out on me during my time of testing. Multipoint connection was also
