

a non-issue for me. The companion app for the LG TONE Free Fit TF7 is the LG Tone Free app. It has a clean interface and provides for all the control and usage customisation options you would want. The controls work well, with every touch being registered without any issues. Hands down, one of the best I have seen in this segment.

While on the topic of controls, my gripe with earbuds without a stem remains when it comes to controls. For instance, if I am lying down with my arm brushing against my earbuds, then the controls get triggered, and it actually hampers my usage experience. This issue is very personal for me, however, accidental touches on non-stemmed earbuds is something that I have wanted brands to fix, so that I can listen to music without having to worry about random pauses and skips.

PERFORMANCE

In terms of performance with the LG TONE Free fit TF7 I had little to complain about. As you can see in the graph below, with the default profile, the sound signature of the buds is very close to our benchmark reading of pink noise, which is a flat sound signature. Meridian tuning FTW for the LG TONE Free fit TF7.

There is a subtle boost in the mids and the highs, which adds some sibilance, but it is nothing that would bother you in the long run. It starts around the low-mids and makes it way into the highs as well, before the

signature normalises and returns back to the base reading of pink noise. In tracks like Rescue Me by OneRepublic, the vocals were clear, and I had no complaints when listening to the track, even when I had transparency mode on. The metal instruments in tracks like Selkies were also clear, and the bass response was also something that appealed to me.

The bass response, with the out-of-the-box settings, is not something that will appeal to the bass heads, and they will have to use the EQ to boost it a bit. However, with the base settings, the earbuds do a great job of providing the much-needed thump in EDM, pop, and hip-hop tracks while also ensuring that the sound is not muddy at all.

The microphone on these earbuds was, again, awesome! During my train rides, where the noise is the highest during my day, I had no complaints from the receivers about the sound quality. The voice was clear and crisp throughout. In certain cases when there were many people around me also having a conversation, the mic had some difficulty in picking out my voice from the rest.

However, in the rest of the scenarios that I put the LG TONE Free fit TF7 through, the earbuds breezed through without any problems.

The battery life on the LG TONE Free fit TF7 clocked in at 5 hours and 12 minutes of battery life with ANC turned on and the volume turned to 50 per cent. The claimed battery life

on these earbuds is 6 hours with ANC turned on. So, good job LG! The earbuds also have fast charge baked in, with the brand claiming that you can get up to an hour of playback with just 5 minutes of charging time.

VERDICT

LG TONE Free fit TF7 make for a great pair of TWS earbuds if you are out in the market looking for earbuds between 10-15K. They sport a great sound signature of the box, which will appeal to people looking for a balanced-sounding pair of earbuds.

The features are well-implemented, and the fit is something that will appeal to almost everyone, with a bit of trial and error with the different wing and ear tip combinations.

The case is a bit bulky, which could potentially be a deal-breaker for some. In which case, you can look at the Nothing Ear (2) or the OnePlus Buds Pro 2. They are priced a bit lower and bring tons of features and sound that makes them a great alternative for the LG TONE Free fit TF7.
