

## Synthetic GPU – High TGP RTX 4050 vs RTX 3060

We'll start things off with the synthetic GPU benchmarks. You'll immediately notice that all of these laptops are very close in terms of numbers. It's actually difficult to point out which laptop is truly the winner here. What's very evi-

dent is that they all easily outperform the RTX 3060 laptop, with the First Strike Ultra DX11 benchmark being the only one that's comparable to the rest.

## Real-world gaming – High TGP RTX 4050 vs RTX 3060

Of course, real-world gaming perfor-

mance is what actually matters. We use a total of 8 games to test real-world gaming performance in laptops, including a mix of old, new and popular titles. This also includes both GPU and CPU-intensive titles so we can get a good idea of how a gaming laptop configuration works as a whole. With that, we come to the numbers.

Once again, we're in a similar position as with the synthetic benchmarks. It almost looks like foreshadowing at this point with how close all of these laptops are. It's difficult to pick out a winner. Maybe medium settings will give us a clearer idea?

Nope. Still very difficult to pick a real winner here. They're all pretty fantastic and the numbers are very close. Of course, the one thing that's clear as day is that they all easily outperform the RTX 3060 gaming laptop. If you scroll up the previous batch, you'll notice that this RTX 3060 laptop outperforms both the low TGP RTX 4050 laptops, so it's actually better value for money. Then again, some of the laptops in this batch are also cheaper than the lower TGP RTX 4050 laptops from the previous batch.

## Verdict – High TGP RTX 4050 FTW

With the scores being as close as they are, you could safely go for any of the RTX 4050 gaming laptops from the second batch. The clear winner in this particular situation is the HP OMEN Gaming Laptop 16 since it's the cheapest of the lot but you honestly couldn't go wrong with any of these options. The other options have other benefits going for them. Go for the ASUS TUF A15 if you want an AMD processor, the Victus 16 or Predator Neo 16 if you want a great display.

The Predator also features the best cooling and build quality of the lot. 9 out of 10 times we would advise against going for a lower TGP variant laptop unless you're severely budget-restrained, and even in those cases, we've seen that RTX 3060 laptops at a similar budget can outperform lower TGP RTX 4050 gaming laptops.
