

ful processor out of the four laptops being compared. That is certainly helping it out a little bit when it comes to the more processor-intensive titles on our list of benchmark games. Especially titles like Valorant.

When we come to the medium preset of real-world gaming benchmarks, the difference becomes even more evident with the RTX 4060 easily having the best numbers in pretty much all titles. Between the RTX 3060 and RTX 4050, the FPS numbers are either very close or higher in favour of the RTX 4050 in most cases as we have seen.

Based on the FPS numbers from these benchmarks, the RTX 3070 and RTX 4060 are capable of comfortably gaming at QHD resolutions and getting at least 60 FPS. Both these laptop GPUs also come with 8GB of VRAM which certainly helps when it comes to gaming at higher resolutions. The RTX 3060 and RTX 4050 could do higher resolutions as long as you bump the settings down to medium or low, depending on the title you're playing. However, you can still comfortably play games at FHD and

get great numbers across the board. The RTX 3060 and RTX 4050 come with only 6GB of VRAM, which can be a limiting factor when it comes to playing at higher resolutions, however, the newer RTX 40 series cards also come with improved DLSS 3.0 (3.5 soon) and frame generation which greatly helps put out better numbers overall as long as the game you're playing supports it.

DLSS 3.5 is basically AI rendering which allows RTX GPUs to provide smoother and faster FPS.

RTX 40 series GPUs also get frame generation, which allows the cards to "fill in the blanks", so to speak, by using AI to generate missing frames and maintain consistent and smooth FPS. This feature isn't present in RTX 30 series graphics cards.

Conclusion – Nvidia GeForce RTX 4050 based laptops offer the best bang for the buck

With that, we've come to a conclusion for our comparison. While the NVIDIA GeForce RTX 3070 offers the best synthetic benchmark performance across the

board, the RTX 4060 comes out on top when it comes to real-world gaming performance. If you're simply looking for the best entry-level gaming laptop GPU, then the RTX 4060 is your best bet here. If you are getting a better deal on an RTX 3070 laptop, however, it might be worth considering.

Just remember to keep the TGP in mind as that can greatly affect a laptop's gaming performance. This applies to any gaming laptop you're thinking about picking up; an RTX 4060 can be outperformed by an RTX 4050 with a higher TGP.

If you're on a tighter budget, then consider going for the RTX 4050 over the RTX 3060 as it does provide better overall gaming performance, especially in newer titles which require much more horsepower to run.

The benefits of DLSS and frame generation also give it a leg up here. Overall, we would advise going for a newer GeForce RTX 40 series gaming laptop to fully utilise the new technology that NVIDIA has on offer and enjoy a better gaming experience.
