

Affordable Apple Watch Ultra revealed in FCC renders

It seems like Apple is working on an affordable version of the Apple Watch Ultra. Check out what is expected to be different about it. The new Apple Watch Ultra renders from FCC have been shared by @ParrotSWD on X (formerly Twitter). According to the renders, the new Watch Ultra will likely come with a familiar rugged exterior. However, upon closer examination, distinct differences can be seen, hinting at the possibility of this being a more budget-friendly iteration of the Apple Watch Ultra.

Apple reportedly says goodbye to Touch ID?

A rumour circulating on the internet claimed that the upcoming iPhone 16 series could include the Touch ID feature in addition to the existing Face ID feature. However, media reports coming in suggest that there could be only little truth to these rumours as Apple is planning to say goodbye to this feature permanently.

Next year's iPhone 16 series, in all likelihood, will not reportedly incorporate the 'Touch ID' feature. This enabled users to authenticate their device through their fingerprints, which is a popular feature with Android.

MediaTek announces Dimensity 8300 processor

MediaTek has recently delivered a new chipset to the market, and this time one for the mid-range smartphones. This is the newly launched MediaTek Dimensity 8300. In certain ways, the Dimensity 8300 is considered to be similar to MediaTek's flagship Dimensity 9300 chipset. It can also be seen as a close competitor to Snapdragon's 7 Gen 3, which was also recently announced. The Mediatek Dimensity 8300 chipset is an octa-core processor and incorporates 4 ARM Cortex-A715 cores along with 4 ARM Cortex-A510 cores. The Dimensity 8300 is based on TSMC's 2nd generation 4nm process.

Compared to its predecessor, the brand-new chipset offers a 20% performance boost and consumes 30% less power, as informed by the company itself.

Moving forward to the GPU, this new Mediatek chipset houses the Mali-G615 MC6 GPU. This allows for a 60% increased performance, and at the same time consumes 55% less power.

It's the era of AI, and keeping that knowledge in mind, MediaTek has also introduced a new dedicated APU 780 AI

processor. This allows generative AI models to run on the device itself, with up to 10 billion parameters. This feature is similar to that previously seen on the Snap-

dragon 8 Gen 3 chip. Next, the RAM speed support on the chipset has been improved from 6400MHz to 8300MHz. This means that while multitasking, one can see a 33% improvement. On top of that, the chipset also supports the more advanced UFS 4.0.
