Apple to sport a new cooling solution on the iPhone 16

Apple made a lot of noise when it launched the iPhone 15 series in September this year. But the disappointment of the users regarding the heating issue on the new iPhone was even louder, bringing Apple a PR nightmare. Apple eventually accepted this and said that this was because of a software bug and rectified the issue. With Apple now gearing up and working on the iPhone 16 series, it seems that it is trying to remove the issue completely from its list of problems. Let's find out how.

Even though we have just received a new iPhone 15 series and there's a long time to go before Apple unveils its next iPhone 16

series, the rumours have started to pour in. One such rumour suggests that Apple could possibly be working to figure out the heating problem through a hardware solution this time. For this, Apple is considering switching to graphene heat sinks on the iPhone 16 and replacing the current copper heat sinks on the iPhone 15 series, according to rumours. Why graphene? Well,

that's simply because graphene offers better thermal conductivity when compared to copper. Apple would pair these graphene heat sinks with new metal bracket housings for the battery. This would allow for better heat transfer and cooling. <https://bit.ly/3GWl5p3>

Maia and Cobalt, Microsoft's first custom AI chip and Arm chip

Microsoft has announced its first AI custom chip, namely Maia 100. This tech giant announced this at the Microsoft Ignite conference in Seattle. Along with the Maia 100, it has also announced an Arm chip called the Cobalt. With these chips, Microsoft aims to compete directly with Nvidia, Google, Amazon, and Intel as well.

Microsoft Maia AI chip

Currently, the Maia 100 is not ready to go public. Microsoft is testing the AI chip for its performance in various applications. This includes the GitHub Copilot coding assistant, the GPT-3.5-Turbo language model from OpenAI and Microsoft, and the Bing search engine (Copilot now). Microsoft is planning to offer more options within its Azure cloud infrastructure with the new Maia 100 AI chip. Not much has been disclosed about Microsoft's first AI chip yet. I guess we are going to have a little

more patience to get to know about the Maia 100 thoroughly. The brand has not even revealed when it will be available for common users.

The Maia 100 is expected to meet the huge demand for cloud infrastructure to accelerate AI workload. Microsoft being a rich and providing company, has invested in developing these chips based on customer feedback.

Microsoft Cobalt Arm chip

Microsoft has also announced the Cobalt 100 Arm Chip along with the Maia AI chip. Now this chip works very differently. The Cobalt 100 Arm chip is more declined towards cloud computing operations. CNBC reported that a vice president at Microsoft, Rani

Borkar, said that these virtual-machine instances that run on the Cobalt chips could be released commercially in 2024 via Microsoft's Azure cloud. She further revealed that when compared to Azure's existing Arm-based chips, the new ones showed a 40% improve-

ment when test runs of the Teams app and Azure SQL Database service were made on it. Looking at this, in the future the Cobalt 100 could be seen as

a potential choice when organizations look for efficient and versatile options in the Azure Cloud system

Both the chips tend to work differently. While the Maia 100 has been developed to do the AI-based work, the Cobalt 100 is supposed to do the computing jobs. <https://bit.ly/46Ui2cy>
