

WhatsApp finally restores view once media feature for all desktop apps

Meta-owned instant messaging platform WhatsApp removed the capability of sending and accessing view once photos and videos via WhatsApp Web and desktop last year. Now, WhatsApp has reversed its decision and reinstated support for sending view once photos and videos across all desktop apps.

According to a known WhatsApp tipster publication, WABetaInfo, the messaging platform is rolling out the ability to send view once photos and videos from desktop apps. Users will now see the button to set the image as a view once message within the caption bar in the drawing editor on WhatsApp for Windows.

It's important to note that this news is not limited to WhatsApp for Windows alone. WhatsApp has also enabled support for sending view once messages from WhatsApp for macOS and linked devices. The reinstatement of the feature to send view once messages from Desktop apps offers several benefits to users. This reintroduction finally empowers users to share photos and videos that are viewable only once, thereby preventing their storage in the device's memory and ensuring a higher level of privacy.

Google Pay may now charge a convenience fee

Long gone are the days when we used to go out to our local shops to get our phone recharges done. Now, our UPI apps are our best friends. Whenever we need to recharge our mobiles, we can instantly do it from wherever we are. Isn't it really convenient?

Speaking of UPI apps, the mobile recharge service on Google Pay used to be completely free of additional costs up until recently.

Now, the platform might have started charging a "convenience fee". Earlier, the UPI app which had more than 60 million active users in India charged only the exact amount for the mobile recharge. On DesiDime forum, Ankush shared that Google Pay levied an additional ₹3 while he was recharging his mobile. He was making a ₹749 recharge for his Jio number. <https://bit.ly/3Nol8hT>

Goodbye controversial Sunbird App?

Sunbird has been a controversial app since the very beginning, to say the least. The company developed an app that allows Android users to send messages to their iOS counterparts on iMessages. For the uninitiated, iMessage is an Apple-exclusive text messaging app, famous for its blue text bubbles. Sunbird has time and again tried to make it accessible for Android customers too and now it even collaborates with Nothing as well. Sunbird has informed that it is shutting down its messaging app owing to privacy concerns. The company shared a notice for users which shared the information of them putting a pause on the messaging app for now. There have been plenty

of reports claiming that Sunbird's messaging platform is not end-to-end encrypted. The pause has been made so that the company can investigate these concerns.
