

for a pair of headphones with ANC. With these headphones you get a soft carrying case as well, which is great to keep all your accessories as well. The case has a pocket for storing the 3.5mm AUX cable, the USB-C charging cable, and the USB Dongle that is supplied with the headphones.

Features

Starting off with the most impressive thing about the EPOS Adapt 360 for me, which was the connectivity. When on Bluetooth, the headphones switched seamlessly between my laptop and my phone when I was taking calls. And the trifecta of connectivity options, Bluetooth, wired, and the 2.4 GHz dongle, ensured that I was able to have a ton of flexibility when connecting to a variety of devices. The latency across the two wireless modes was also great, with there being very limited instances where there was noticeable lag in audio.

Now, coming to the features that EPOS has baked in for people juggling between meetings and calls. When you are connected to a PC with Microsoft Teams installed, and the BTX 800 USB dongle that comes with the headphones is connected, you can launch Microsoft Teams with a single click. This feature worked well for me for the most part. Only when I was more than 3 feet away from my system I encountered a few hiccups. There is app support for these headphones as well, but after multiple tries on my Apple iPhone 13 Pro, I was not able to get the app to detect the headphones. However, given that seems to be more of a software issue, so it can be fixed by EPOS in a future update to the app.

The remaining features of the EPOS Adapt 360 come in the form of audio tuning, ANC, and the microphone tech packed into the headphones. So, let's move on to the performance section.

Performance

First, let's talk about the ANC. The ANC on the EPOS Adapt 360, in my opinion, has been optimised to work

best in closed spaces, without much noise, like offices. The headphones do a great job of drowning out sounds like people speaking in the background and constant low-end drones of the AC units and PC fans. When you step outdoors, you get the real taste of the ANC, which is not as strong as you would expect from a similarly priced mainstream consumer headset. And, I guess, if we keep the target audience for these headphones in mind, the headphones do a good job.

For calls, the EPOS has added a pair of microphones on the headset, which ensures that the voice pickup is on point. Again, in closed spaces, the headphones performed well but struggled in outdoor environments with a lot of noise around. Main use case, check. As you can see in the graph down below, the headphones have a V-shaped sound signature, with there being a boost in the low-mids to the mid-treble range.

You will also notice the bump in the lows, which is where these headphones get their thump from.

Considering that these headphones are meant to be used for taking calls, the sound signature is on point. The boost in the mids and the highs means that almost all the vocal ranges are covered and are reproduced well. And, the added bass rounds up the experience, if you decide to take a break and watch a few videos or listen to some tunes. Generally, the boost in the highs, means that there is sibilance in the sound, which in the long term causes discomfort to the people who are susceptible to it. However, in this case, it has been taken care of by the brand. The boost to the high frequencies is not enough to introduce a LOT of sibilance to the sound of these headphones.

Lastly, there's the battery life. EPOS claims that these headphones can last up to 30 hours with ANC on, when you are listening to content. In my tests, the battery lasted 28 hours and 45 seconds (ANC On, 90 dB SPL). These numbers are pretty close to EPOS' claim and you should be able to work with these headphones through the day without any hiccups.

Should you buy?

This is one of the most critical questions to answer with the EPOS Adapt 360 headphones. When you are out to get these headphones, you need to look at what your needs are. If you are someone who is put at their test through the day, hopping between meetings, and taking calls, with little to no need for headphones suitable for long periods of content consumption, then go with the EPOS Adapt 360 ANC. But, if you are someone who is looking for an all-round solution, I would recommend going for the Sennheiser HD 450 SE, or if you have the budget, go for the Sony WH-1000XM5 or Sennheiser Momentum 4 Wireless headphones. They bring a host of features along that will boost the day-to-day regular use, better ANC, and sound that will be better suited for content consumption.
