

is in terms of demand for video solutions. We are slowly becoming non-camera shy, I would say. Right? You look at the number of people who are doing video calls on WhatsApp. Once upon a time, WhatsApp was primarily used for messaging. Then people said, okay, network is not the same everywhere, let me use WhatsApp for audio calling. Now, almost every second call on WhatsApp is on video. So I think people are becoming more and more comfortable using video as a mode of communication. So that is the reason that I am saying, in the day-to-day life, what we are doing is what we have been doing. And then the third thing is especially in the enterprise space as we have been speaking you know multiple times, except for a few verticals in the market like let's say healthcare or manufacturing, almost all of the other verticals are still in extreme hybrid mode. Right?

I mean we are all reading in the newspapers, large IT service companies are actually incentivising people to come back to office and still it is difficult for them. This means for the foreseeable future this hybrid is going to stay, it is not going to go away. If hybrid is going to stay, then I think it's only

fair that the organisations look at how to make it easy for customers. So I think that is the first thing that we are seeing. The second thing is that we are seeing that the technology is not going to be able to make it easy for people to adopt hybrid. Collaboration is the name of the game. Without collaborating with your colleagues, without collaborating with your partners, you are not going to be successful as a business. So if that is acknowledged, then what else do you have to do to make collaboration easy for people? So I think these are some of the trends that we as an organisation are seeing that are driving the demand for video solutions.

Q When you are developing products for both your consumer vertical and the business vertical, how much of the technology insights will be shared between the two development teams? For example, the Hero sensor from Logitech's gaming mice; how much of the learnings from the development of the Hero sensor will carry on to the development of a product like the MX Master 3?

A As a manufacturing company, we take

our lessons in the development of the product. We take our lessons into our product evolution. We take feedback from the market. There are things people may fall in love with that we provide. We are no exception. There are obviously things that we make that people want better, right? So we take those feedback, and we try and improvise on our products.

Now coming to your core question of how much of a similarity we are seeing between a consumer range of products and an enterprise range of products. Again, as a manufacturer, we are not going to be the same. As a manufacturing company, we may be reusing some of the components, for example, batteries, for example, microphones, because some are great. We may be reusing them across different products between these two businesses. But the expectation from the target audience, let me tell you, is very different. **d**

NETGEAR GOING BIG WITH AV-FOCUSED NETWORK SWITCHES

Satvik Pandey | satvik@digit.in

NETGEAR, launched its Enterprise-Class AV M4350 Series Switches at InfoComm India. These switches are specifically designed for AV over IP (AVoIP) and come with dedicated service and support. The switches feature a unique NETGEAR AV user interface and Engage Controller with pre-configured profiles for all major audio, video, and lighting protocols.

In addition to the M4350 series, NETGEAR offers over 200 switching products for AV over IP. These products enable businesses to connect any type of AV over IP device and offer flexible speed options ranging from 1Gbps to 100Gbps per port. They also support Power over Ethernet (PoE) and can be used for powering security and surveillance products. NETGEAR expects to double its year-on-year

sales in India. Recognising the growing trend of video over Ethernet, NETGEAR has designed its products for AV over IP installations. The products feature NETGEAR IGMP Plus for out-of-the-box functionality for most multicast installations and modular switches that accommodate copper, fibre, and HDMI inputs. NETGEAR aims to help the ProAV world adopt IP as its delivery method of choice. Commenting on the new launches of these switches, Marthesh Nagendra, Sales Director, India MEA South-East Asia Region, NETGEAR, said, "The recent expansion of our R&D space to 100,000 Sqft in Bangalore is a testimony to our commitments in the AV space. A major portion of this space will be utilised for developing new products on the AV line. I am happy to note that continuing our growth streak, we are confident to double up our YoY Sales in commensurate with our investments in the country." **d**
