

Musky AI AI AI

A look back at the tech news from 2023

Boo-Man | boo@digit.in

2

2023. I can think of two thousand and twenty-three ways in which I did not like what went down this year. This year was the first one where we did not have a raging pandemic to deal with, and good god, the human race showed what it could do. If it was in a good way, then you would not see me write an entire piece about it. However, what went down... I don't want to give it all away. I don't have enough patience to write an elaborate intro. And, on this topic, I would not write one anyway. Read through the story. I am sure you are someone with an attention span less than that of a goldfish, so take this as a channel and post it on your social media handle - #BooManChallenge. Go flex.

AI AI AI AI AI AI AI AI AI

I remember watching movies about how things would be automated in the 2020s. And, if you look at it, they are. Command your phone to set an alarm by screaming at it, and you shall get it done in three tries. Write a prompt, and you will get a render of an image that does not exist. And, if you still have

time, you can have conversations about anything and everything with your computer. Fun times, right?

WRONG. Touch grass people. And learn to do things on your own.

Every tech corporation on planet Earth is scrambling to make its own AI. But for what? For Tumblr user SteveJobless69420 to generate images of a racoon riding on a bicycle through the Alps? I mean, where does it end? With AI coming into the picture this year, I have seen people becoming lazier and refusing to learn things on their own. You ask them to write a simple code, they say AI will do it. Ask them to prepare a CV, AI is there to do it. Reels? AI will do it. There are courses that people are taking to become "Prompt Engineers".

Back in my day, being an engineer meant that you were out there, getting your hands dirty. Not sitting in your room, sipping lattes and clickity clacking away on your keyboard. I can pen it down. The way things are going, this breed of engineers will be like lift operators. And, about generating content with AI, there are two sides to the coin. However, the scales right now are tipped more to the side of AI tools being more of a time, which I see being made good use of in the right hands.

I know you might come at me with an army of X-ers or whatever they are called they are called these days, I will

talk about that later. I say, come at me. I will use the same AI tool you are using to generate Tweets that you would cry after reading.

X-Musk

What happens when you give a person with a high IQ and enough money to sustain a country? He buys one of the most popular micro-blogging platforms, makes changes to its operations, and changes its name a hundred different times. If it was not clear already, I am talking about one Mr Elon Musk here.

The man has been on a roll.

I don't know what he wants to do with Twitter, but the way he is doing it makes me angry. Actually, it did for a bit, and now his X account is more like a comic strip, which I often visit before penning down this article. It gives me the right amount of annoyance to get things done. He introduced community notes, and much time did not pass before we saw handles like "Community Notes violating people" crop up and showcase what an absolute joke of an idea it turned out to be. I sometimes like what he is doing. But his actions have led him to be a parody of himself.

I have a lot to write, but not enough words. Literally. But, after reading my takes, I think you would get an idea of what I thought about the rest of what went down in the world of tech in 2023. Write to me at booman@digit.in and let me know what you think about tech news from 2023. Until next year! 🇮🇳
