

Sonic Lamb Headphones

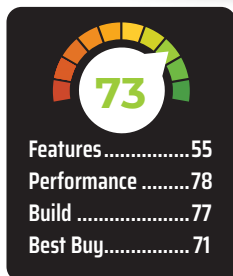

A solid pair of headphones that are destined for success with some improvements

Developed on our own home turf by two ambitious engineers, the Sonic Lamb Headphones have created waves of excitement, not only in India but overseas as well. All of it is just because of their tuning, usage of cutting-edge technology and the experience they give the users. I was fortunate enough to be one of the few people chosen to get hands-on experience with these headphones, and I am not going to lie; it seemed too good to be true before I started testing these headphones. By now, you may have guessed that I was impressed by these headphones a lot. However, there are a few kinks in the armour, which I would love for the makers to hammer out and make these, hands down, the best pair of headphones in the market in their budget category. With that said, let's find out what made these headphones stand out and grab the runners-up spot in the Digit Zero1 Awards 2023 and what held them back –

BUILD AND DESIGN

The Sonic Lamb Headphones impressed me with their build and design, hitting the right notes from the get-go. These headphones sport a complete plastic design, which on paper seems to be something that would hold you back from getting these headphones for ₹15,999. However, the engineers behind these headphones have ensured that the build quality of the headphones is not affected by the plastic that is used. It is robust and stands through the creaking test that we do with all the headphones that come into our Test Centre. The ear cups are replaceable and extremely comfortable. They do a great job of passive isolation as well. The

₹15,999

makers of these headphones are calling the ear cup pads "Wooferspads". More on that later. These pads are some of the best I have seen on headphones, especially at this price.

Coming to the design, these headphones sport a mostly monotone design with accents on the cans. There is an indicator LED on the earcups, with the bass toggle, buttons, and the boom-mic/USB-C port making an appearance on the bottom side of the cups. There is some subtle branding on the headband and the earcups. Nothing too flashy. The buttons on these headphones are also built well, with a nice and satisfying tactile feel and a tight and snug fit. Same is the case with the bass control wheel. Talking about being snug, these headphones sport a swivel design on the ear cups, which means that you

get a nice and snug fit on the head, which, as I said, ensures good passive isolation and minimises sound leakage, even at high volumes. Overall, the Sonic Lamb Headphones are well built and bring to the table, a design that many can sport without being conscious about the colours and appearance of the headphones. Moving on to the features.

FEATURES

The Sonic Lamb Headphones are not the most feature-rich pair of headphones out in the market. However, when I spoke to the makers of these headphones, their rationale was fairly convincing. They said that they wanted to ensure that these headphones functioned well and performed above and beyond the industry standards before they went in gunning for features. And, given that this is their first attempt at making a pair of headphones, it is worth giving them a pass.

However, it's not all bone dry here. These headphones support audio codecs like aptX and aptX HD, which means you can play back high-quality audio on them. Additionally, you get customisable sound, which is achieved through their Sonic Lamb app. And, unlike some of the other headphones in the market which support audio tuning based on your head, the one included on these headphones actually works. I tried it myself and was surprised to see the difference it made. However, note that the sound signature testing was done without any special tuning, as is the case with all the headphones that come into the Digit Test Centre.

You cannot tune the audio using an in-app EQ. However, there is a bass level customisation wheel on the side, which you can use to change the intensity of the bass that you're getting from the special bass drivers on these headphones. There are four different modes that you can choose from — Hear, Feel, Immerse, and Beast. Now, I will use the wordings of the makers to explain these modes, because they did it really well.

Hear - The most accurate sound profile great for classical and instrumental genres. Optimized for activities like podcasts, audio books, calls and meetings.
