

Samsung Galaxy Book3 Ultra

A Creator Windows Laptop That Checks All The Right Boxes

Alright, here's the Samsung Galaxy Book3 Ultra review and I had a pretty fun time

writing it. It's like Samsung threw everything but the kitchen sink into this baby. It's got a screen that'll make your eyes pop, a processor that chews through tasks like it's nothing and a look that'll have you wanting to show it off. But I'm not just going to take their word for it – I'll be putting this laptop through its paces to see if it lives up to the hype.

DESIGN, BUILD QUALITY, KEYBOARD, AND TRACKPAD

The design of the Samsung Galaxy Book3 Ultra is clean and modern, with a no-frills approach that keeps things professional. It's slim and doesn't scream for attention, yet it has a quality feel that suggests it's not just another laptop. The colour and finish are chosen for a look that's versatile enough to fit anywhere, from a casual café to a corporate boardroom. It's clear that Samsung aimed for a design that would be timeless rather than trendy, ensuring the Galaxy Book3 Ultra looks good now and will still hold up in the years to come. The clean lines and refined finish give it an air of elegance that stands out in a sea of plastic-clad notebooks.

The Galaxy Book3 Ultra feels robust enough to take the knocks and bumps of daily travel, yet it doesn't compromise on its lightweight charm. The chassis is rigid, likely thanks to some high-grade aluminum, and it's got the kind of build that reassures you that the premium you paid was worth it. The keyboard on the Galaxy Book3 Ultra has a key travel of

₹2,81,990

1 mm, which is on the lower end of the spectrum. The keystrokes are satisfying, giving you that immediate feedback that's so crucial for fast typists or those late-night essay crunches. The LED back-lighting is the cherry on top, illuminating the keys with a soft glow that doesn't tire your eyes, even as it guides your fingers in low-light conditions.

The trackpad on the Galaxy Book3 Ultra is what you'd want in a laptop: big, responsive, and no-nonsense. The surface is smooth, making for easy navigation, and the click is satisfying without being too loud. It's precisely the kind of trackpad that gets the job done well, which is what you need whether you're working through a spreadsheet or scrolling through your social media feed. It's all about function meeting form in a way that feels effortless.

SCREEN AND SPEAKERS

The Samsung Galaxy Book3 Ultra, which has been garnering attention for its impressive features, is a topic of interest for many

tech enthusiasts looking for a comprehensive review. This device boasts a sizable 16-inch AMOLED display that brings visuals to life with a pixel-packed 3K resolution of 2880×1800 pixels and a fluid 120Hz refresh rate, making for smooth scrolling and crisp image quality. With a screen-to-body ratio facilitated by a 16:10 aspect ratio, the display is both expansive and immersive, offering more vertical space, which is beneficial for productivity tasks like document editing and web browsing. The display's quality extends to its brightness, averaging around 399.3 cd/m² with a peak of 412 cd/m² (nits), which indicates that the screen is sufficiently bright for indoor use and competent for some outdoor scenarios, although, in direct sunlight, visibility may be affected due to the reflective surface of an OLED panel.

This level of brightness is typically considered good among laptops, allowing for clear visibility in various lighting conditions. Viewing angles on AMOLED screens are generally excellent, providing consistent colours and contrast from off-center perspectives. This ensures that the image quality remains stable even when viewed from the side, making it good for sharing content with others around you.

One thing to note, however, is that the OLED panel can exhibit flickering at brightness levels of ≤ 100 percent at a frequency of 240Hz due to the brightness control of the panel, which might be sensitive to some users.

Overall, the Samsung Galaxy Book3 Ultra's display is crafted for those who demand high-quality visuals, whether for work or entertainment, offering a robust balance of resolution, refresh rate, and colour fidelity that should satisfy both everyday users and demanding professionals.

In my testing, I found that the Samsung Galaxy Book3 Ultra has an sRGB colour space coverage of 151%. Such a high colour space coverage suggests that the display can reproduce a much wider range of colours than the standard sRGB space, leading to more vibrant and diverse colours.

DCI P3 is a colour space with a wider gamut than sRGB, used mainly for digital movie projection and by Apple Inc. for wide-gamut displays. It's particularly
