

AI Hype Alert!

Not too long ago (Dec 2023), I was super excited about the upcoming AI wave hitting in 2024. That excitement hasn't faded at all. But as I sit here at the airport, prepping for CES 2024, it's pretty obvious: AI marketing will steal the spotlight in 2024, overshadowing the actual progress in AI technology.

Everywhere you look, it's all about AI. Every talk, every new product at CES 2024—it's all stamped with AI. Don't get me wrong, AI is cool! But here's the catch: not everything needs AI to be awesome. Sometimes, sticking an 'AI' label feels more like a fashion statement than a real tech upgrade.

Big tech companies are all in a race to be the 'most AI-driven.' But in this race, the real breakthroughs sometimes take a backseat. More AI doesn't always mean better gadgets, especially when most of today's AI talk revolves around cloud or on-device generative AI models.

Getting ready for CES 2024, I'm getting set for a parade of flashy displays showing off their AI superpowers. But what I'm really after are the real game-changers—those inventions that truly redefine what AI can do. Sorting the genuine innovations from all the buzz will be tough. I'm particularly curious about what robotics and car tech might unveil—those areas could surprise us with groundbreaking stuff.

We don't have to fall for every gadget shouting 'AI-powered.' Let's aim for meaningful AI that solves problems or makes life simpler, not just adds sparkle.

AI is powerful, no doubt. But if it's all just about show-off, we're missing out on what it can really do. At CES 2024, my goal is to dig into the tech world and find the true AI innovations. Some are talking about using AI to help in reporting—an AI buddy that sorts info and gives updates in real-time. It's a cool idea, but AI crunches numbers, not stories.

Exploring inventions, understanding their impact—that's the human stuff AI can't match. And I am fully aware I'd be

“AI is powerful, no doubt. But if it's all just about show-off, we're missing out on what it can really do.”

Soham Raninga
Editor-in-Chief

proven wrong soon, AI will find a way to match the human ways of storytelling. Until then, let's keep at it.

As I headed to Las Vegas, I caught a couple of sci-fi movies—almost seemed like fate. One depicted AI gaining consciousness, turning against humanity, while the other spun the tale of AI as the hero, humans playing the antagonists, fearing its intelligence. It's a tug-of-war: AI as a threat or savior, showing our complex relationship with it.

Ignoring morality, it's evident that movies are leveraging the AI craze. This hints that 2024 will be AI's year, not just for tech strides but also for the marketing mayhem it'll bring.

As I head to CES 2024, fascinated by the world of tech, I invite you to join me. Let's dive into this adventure together, sift through the noise, and find the tech that will really change things.

CES 2024 isn't just about fancy displays; it's about the real stuff behind the scenes. I can't wait to jump into this journey, discovering the innovations that will shape our future. Join me on this quest for genuine AI innovation. **d**
