

bloating prices and adding complexity for little to no enhancement.

Over-automation is a serious risk, where routine tasks get automated for no clear cut practical benefit, removing active user control which can lead to lots of issues – like privacy concerns. Smart devices of all shapes and sizes collect user data, raising concerns about privacy violations and potential misuse. And if everything's smart and starts getting connected to the internet, wouldn't it be more prone to cyber threats? I mean, do you really want your 'smart' toilet to not work because it got hacked? I don't know about you, but I definitely don't want to live in that future.

12 Video games aren't a waste of time

While most of us look at video games as entertainment or leisure-based activity, they are proven to have multiple educational and cognitive benefits. Many games help train and hone a player's problem-solving skills, with adequate planning and strategic thinking. First-person shooter games can help improve hand-eye coordination, reaction times and dexterity, while adventure or RPGs can help improve your memory as well. Simulation games can be great teaching tools for imparting specific skills or educating the player with themes related to history, culture and tradition.

Obviously, there's more: multiplayer games for example can teach players how to behave in a group for successful gaming sessions. In the internet age, gaming can help expand social circles as well by helping

build friendships. Games can put people in various personas, which can help boost their emotional quotient. Mastering a game obviously builds confidence, which can rub off on other aspects of the player's personality. Excessive gaming can have negative consequences if it disrupts other aspects of life, sleep, or social connections, hence it's important to inculcate responsible gaming habits into a balanced lifestyle.

13 Don't blame technology for cyber scams

While technology can provide vulnerabilities or fall victim to malicious actors, ultimately, responsible digital practices and individual choices play a crucial role in safeguarding ourselves online. Security threats come from users, not just technology lapses. Phishing scams, weak passwords, and user fumbles are just as big dangers as sophisticated malware. Cyber security education of all shapes and forms is crucial to understand the rapidly evolving nature of cyber security threats. And just like you practise vigilance in your daily life, so you should behave when doing

anything related to technology tools. Remember that technology is a tool, not a shield. Be aware of security threats, stay informed about current risks, and adopt safe online habits for yourself and your friends and family.

14 Not everyone can be a professional creator

Whether it's YouTube or Instagram,

Twitch or some other platform, the creator economy isn't for everyone – in contrast to what these platforms would like you to believe. Don't get me wrong, as a consumer, I love the creator ecosystem, I mean don't we all? It's great to be able to learn

something new, live vicariously through someone else on the screen or stay engaged whenever you want, thanks to all the various creators we follow on the internet.

Understand that content creation requires a diverse set of skills – everything from writing, scripting, video editing to presentation and marketing. All of this is secondary, because fundamentally you need to possess something which will be of value to your viewers – some sort of subject matter expertise or artistic style that will keep people hooked. Achieving all of this is easier said than done.

15 Overdependence on technology is bad for your skills

If technology makes substantial inroads in all walks of our lives, what will we do? Just take driving, for instance: the fact that reliance on GPS technology is diminishing people's innate navigation abilities and spatial
