

Another year of foldables

It's just a mirage of promises

Boo-Man | boo@digit.in

Ah, the year 2024, where the tech industry continues to peddle the illusion of innovation. The latest entrant in this grand charade? Foldable smartphones. Yes, you heard it right. Our beloved tech giants are now selling us phones that fold. Because, apparently, having a phone that fits in your pocket isn't enough anymore. Now it needs to fold too.

The first wave of these foldable marvels was, to put it mildly, a disaster. Remember the screens that cracked faster than an egg in a frying pan? Or the hinges that collected dust like a vacuum cleaner? But hey, who cares about practicality when you can have a phone that folds! Fast forward to 2024, and we're still being sold the same dream. The tech giants promise us that they've ironed out the kinks. The screens are tougher, the hinges are better. But let's be real, it's still just a phone that folds. It's like putting lipstick on a pig and calling it a supermodel.

And let's not forget about the price. For the cost of these foldable phones, you could buy a decent used car. But no, we're supposed to shell out a small fortune for a phone that provides the same functionality as its non-foldable counterpart, but with the added 'benefit' of folding. The tech industry

wants us to believe that foldable phones are the future. That soon, everyone will be carrying around a phone that folds. But the reality is, it's just another gimmick. Another attempt to make us believe that we're getting something new and exciting, when in reality, it's just the same old technology in a different package.

phones are supposed to be portable, right? So why do they feel so fragile? Every time I open one, I feel like I'm going to break it. It's like holding a newborn baby. You're constantly worried that you're going to drop it or break it. So, here's to the future of foldable smartphones. May they continue to be the overpriced, overhyped, and

But wait, there's more. Let's talk about the user experience. Have you ever tried typing on a foldable phone? It's like trying to type on a waffle. The keys are all over the place, and the screen keeps moving. It's a nightmare. And don't even get me started on the crease. You know, that annoying line that runs down the middle of the screen. It's like having a permanent smudge on your glasses. And then there's the question of durability. These

underwhelming devices that they are. Because at the end of the day, it's just a phone. And no amount of folding is going to change that.

The future of foldable smartphones is uncertain at best. They're expensive, impractical, and riddled with problems. But hey, at least they fold, right? So, if you're thinking about buying a foldable phone, maybe think again. Because the future of smartphones isn't foldable. It's practical. **d**
