Will AI eat up your job?

Artificial Intelligence is all the hype currently and has been for a while. It is getting more popular than we would like it to be. And with AI's popularity growing, so is the fear among many job holders. Ever since the AI craze saw a surge, people have been worried about the fact that AI would eat up their jobs and replace them. Is there any truth to this? Well, yes. It is quite possible that Generative AI could replace humans in certain tasks. But is it going to happen anytime soon? Studies suggest otherwise.

A recent study conducted by the Massachusetts Institute of Technology

(MIT) gives us a glimpse of a more realistic timeline of when Generative AI could take over human jobs. Spoiler alert, it is not going to happen anytime soon so you can relax. The study titled "Beyond AI Exposure: Which Tasks are Cost-Effective to Automate with Computer Vision" was conducted by five researchers at MIT. They researched tasks that were seen as suitable for AI, these included but were not limited to those tasks performed by teachers, property appraisers, and bakers.

The study revealed that AI has not evolved as much as the human brain has and how it functions. It doesn't offer human instinct and intuition

despite working on algorithms and patterns. One thing that AI cannot replace is how humans work. It cannot replicate the depth of human conscious and subconscious thought processes. And is lacking in tasks that require intuition, gut feeling, and implicit knowledge. These factors remain integral and unique to human critical thinking and emotional intelligence and cannot be easily automated.

On top of that, another major reason behind this is money. It is not economically viable to replace human labour with AI currently. Setting up AI in a workplace and its maintenance requires a lot of funds. The study noted that a meager 23% of the workers' wages for the above-mentioned jobs could be replaced by AI. Further, it revealed that even if AI reduces the annual cost by 50%, we might not be able to see half of the vision tasks achieve a machine economic advantage by the year 2026. Adding to that, it was noted that jobs that favour human labour will persist until 2042.

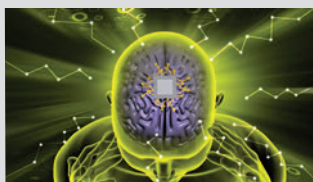

However, the research also pointed out that even though only 3% of the tasks out of 800 occupations that AI can do are economically automatable currently and majorly require human input, this number could increase to 40% by 2030.

■ **NEURALINK**

Neuralink initiates human Brain Chip implantation

What if I told you that humans can now control their devices just by thinking about it? Yes, it's possible now. It feels like living in the future, where technology has gotten advanced so much that it's being used to treat people—an idea we've seen only in movies. Personally, I feel it's like having a superpower, isn't it? Now, the question is, how is it possible? Well, Elon Musk is the man behind this. This

could be another major achievement for him, following Tesla EVs and SpaceX. Elon Musk's neurotechnology company, Neuralink, has successfully implanted the first brain chip inside a human. Let's delve into it further!

Musk announced this news on X (formerly Twitter) that Neuralink has successfully implanted a brain chip called 'Link' in the first human. <https://bit.ly/484qsi8>
