Google Lumiere could break the AI ceiling

We are all astonished by the growth that we're seeing in the Generative Artificial Intelligence space. We've gotten used to ChatGPT, which generates text based on our written prompts. In recent times, we have seen AI create videos too. ChatGPT has it now and other companies too. Today, we are going to talk about Google Lumiere. It creates

videos from the prompts that you type in, and it does it pretty well. Let's find out more about it.

Google has recently launched "Lumiere." Now, what does it do exactly? Google Lumiere

is a video-generation AI model. It uses a new diffusion model which is known as Space-Time-U-Net, or STUNet. This STUNet works on the concept of space and time. So it is basically where things are in the video and how they will eventually move and change. This process allows Lumiere to create the video in a single go instead of going by the traditional route of putting smaller still frames together.

iOS 18 could go big on AI

With all major smartphone companies being on top of their games, Apple doesn't want to stay behind. Currently, Apple is working on another iOS update and we hear on the grapevine that it is going to be the biggest update ever. iOS 18 is

being highly awaited and a Bloomberg report reveals that this could be "one of the biggest iOS updates — if not the biggest — in the company's history." But what will this update

include and what can we expect? Read along to know it all. According to a report by Bloomberg's Mark Gurman, we can expect a lot with iOS 18. He said, "Apple's head of software engineering, Craig Federighi, told employees last year that the OS — codenamed Crystal — will have ambitious changes all around," Gurman reports. <https://bit.ly/3S4Q4vPv>

What's new in Microsoft Copilot Pro?

All major tech companies are running the race for it. Today we are going to talk about Microsoft's Copilot. For the uninitiated, Copilot is an umbrella brand for Microsoft's AI-powered, content-generating technologies. Now, Microsoft has launched the "Copilot Pro." Now it includes a consumer plan that will cost you \$20 per month. With this, you will be able to access Copilot GenAI features in Word, Excel, PowerPoint, Outlook, and OneNote on PC, Mac, and iPad, provided you have a Microsoft 365 Personal or Family plan. <https://bit.ly/4boc6fb>

Google Chrome to get new generative AI features

Google has introduced three new experimental generative AI features for Google Chrome to make it more easier and efficient to browse. The new features are Tab Organizer, custom themes and Help me write on web. Tab groups are a helpful way to manage lots of tabs, but curating them manually can be a difficult process. With the new Tab Organizer feature, Google Chrome will automatically suggest and create tab groups based on your open tabs. This will be particularly helpful if you're working on several tasks in Chrome simultaneously. <https://bit.ly/42xbq3m>

26 billion records leaked. Is your data is safe?

A large data breach, referred to as the "Mother of all Breaches" (MOAB), has exposed 26 billion records from prominent companies such as X (formerly Twitter), LinkedIn, and more. This extensive data leak contains 12 terabytes of information, comprising a mix of both past and recent data. The leak was discovered by a cybersecurity researcher from Security Discovery and Cybernews. According to the report, the leaked dataset mostly has information from previous data breaches, but it does include new data that was not released before. <https://bit.ly/48bF6Ea>
