

Photo and Video editing features

The series also showcases Samsung's focus on creativity and content creation. The AI-powered ProVisual Engine is a highlight, especially in the S24 Ultra. It enhances the photography and videography experience by enabling users to capture and edit content with professional-quality results. The engine includes advanced editing tools powered by AI, allowing for automatic enhancements and suggestions that improve the overall quality of photos and videos. Google Pixel devices have exclusively had intelligent features such as the Magic Eraser for a while and now even the Samsung Galaxy S24 Ultra has this feature.

Additionally, the AI features extend to search capabilities, making information retrieval faster and more relevant. One way this works is that you can take any image from your library or from any service or article and then circle it with the S-Pen. The phone will prompt you with a few options, one of which allows you to search the web for the small section that was circled. The AI algorithms can then provide contextual follow-up options as well. Let's say you'd circled a tourist spot in an image, you can then ask the phone to plan a travel itinerary. The AI algorithms are designed to learn from user preferences and behaviours, providing more tailored search results and recommendations.

Samsung Knox gets passkeys

The integration of AI in the S24 series also extends to user security and privacy. Samsung Knox has been Samsung's

answer to alleviate all concerns relating to security and privacy. The devices are equipped with advanced security features powered by AI, ensuring that personal data and device functionality are protected against unauthorised access and threats. Not all AI features on the new Samsung Galaxy S24 series are based on the local AI model. Some features do require external processing over the internet and you get to choose to disable any features that might carry your personal information off the device for online processing.

Passkeys have been getting quite a lot of attention as a more secure evolution of passwords and Samsung Knox now supports passkeys. Aside from passkeys, the usual set of features such as Knox Vault, Security & Privacy Dashboard, Auto Blocker, Secure Wi-Fi, Private Share, Maintenance Mode and others will be present. Let's look at the devices starting with the flagship.
