

the best available processor from Intel paired with the best available GPU from NVIDIA. The RTX 4090 comes with a TGP of 175W, which is the highest allowed TGP by NVIDIA. Add to that the 64GB of DDR5-5600 RAM and you can see why this laptop is currently our best-performing gaming laptop.

We got the highest real-world gaming benchmark numbers we've seen yet in a gaming laptop on the MSI Raider GE78 HX. After running our laptop through our usual suite of games, we found most titles got north of 200 FPS at high settings in FHD resolutions. You could easily see 60+ FPS on modern

AAA titles at QHD resolutions and Ultra settings with the specs on this laptop. The 16GB of VRAM on the RTX 4090 also really helps with high-resolution gaming, and you get the benefits of Frame Generation and DLSS if a game supports it to significantly boost FPS numbers even more. The FPS numbers speak for themselves.

The same applied to our synthetic gaming benchmarks as well, with the Raider scoring the highest scores we've seen across the board, even surpassing the GT77 Titan we tested earlier in 2023. We will point out that while both laptops featured RTX 4090s, the Titan

we tested came with a slightly weaker Intel Core i9-13950HX, which is why the Raider 78HX was able to inch ahead.

VERDICT

The MSI Raider GE78 HX is a beast of a gaming laptop with top-of-the-line specs across the board. It's a straight-up improvement over its predecessor and our best-performing gaming laptop of 2023. It features a retro aesthetic which might not be for everyone, but it's subtle enough in our opinion other than the 8-bit pixel RGB lighting on the base. While it features good build quality and overall design, we were a bit disappointed when compared with other laptops in this price segment, especially the keyboard which feels very cramped. However, if it's pure performance you're chasing, this is the best we've tested to date.
