

with an NVIDIA RTX 4050 Laptop GPU with a TGP of 140W, which is the highest allowed by NVIDIA for the 4050 on laptops. In terms of numbers, it's comparable to and even better than the RTX 3060 in certain titles, especially newer AAA titles. The 12th gen Intel Core i7-12650H, while not the latest available SoC, that would be the new 13th gen processors (now even 14th gen for desktops), is still a solid processor, especially for your gaming needs. Paired with the newer

DDR5 RAM on board on the 2023 Acer Nitro 5, you can easily expect to get 60+ FPS on modern AAA titles at high settings on FHD resolutions. Running benchmarks across our usual suit of games, we saw that the Acer Nitro 5 doesn't particularly stand out, but it doesn't lag behind as well. We see this as an overall good thing considering its competitive pricing and its excellent thermal performance.

The same is reflected in synthetic benchmarks as well, with the Nitro 5

at the middle of the pack in terms of overall numbers. At least, when compared to laptops with 13th gen processors and similarly specced GPUs. The Nitro 5 is easily top of the pack when compared to other 12th gen processor gaming laptops.

VERDICT

Overall, the new Acer Nitro 5 AN515-58 (2023) is a solid step up over its predecessors, with improved thermal performance and build quality. While it's bulkier and heavier, this has helped improve overall stability, and we can take a gander that it has helped maintain better temps as well. The keyboard is still excellent but the display is average at best.
