

Unfolding the Intel AI Everywhere Story at CES 2024

Team Blue has the AI game in the pocket?

Soham Raninga | soham@digit.in

At CES 2024, we saw Intel make a big splash with new product announcements that align with its vision of 'AI Everywhere'. Sure, AI is the buzzword, and every upcoming tech product is figuring out AI integration to make it forward-looking and next-gen. However, with the Intel AI Everywhere narrative, we witnessed a ground-up approach towards leveraging AI to enhance productivity and, more importantly, enable newer experiences. The biggest announcement in our books was the Intel SDV

platform. It is a fine example of Intel's ground-up approach to AI in the automotive industry. We also experienced Intel's Core Ultra AI processors in action, with demos and workshops that showed the NPU cores in action and how they are great at managing common generative AI tasks on the edge (on-device). Besides the AI story, Intel's swift and definitive approach toward strengthening its GPU portfolio and offerings was another highlight that impressed me a lot. Intel's ARC IGP in the Core Ultra H series of

processors is a massive upgrade compared to the previous Intel Iris Xe integrated graphics. Add the Intel XeSS super sampling into the mix, and you get thin and light laptops that are ready for gaming! Sure, you have to keep the eye candy (graphics) in check, but the Intel IGP is now ready for gaming, and that's big news.

Intel SDV is a holistic approach to in-vehicle AI compute

The Intel SDV Platform is the industry's first open automotive chiplet platform, coupled with prominent contributions to standards development in collaboration with SAE, aiming to introduce advanced vehicle management solutions to the automotive industry. At the CES launch of the Intel SDV Platform, Intel CEO Pat Gelsinger took the stage to announce the acquisition of Silicon Mobility, a company specializing in intelligent electric vehicle (EV) energy management technology. He also announced Zeekr as the first OEM partner to embrace these chips, planning to integrate generative AI-driven experiences into their next-gen vehicles' living spaces. The new Intel AI-enhanced software-defined vehicle (SDV) SoCs will
