The advancement of optical zoom, specifically through telephoto cameras, is one of the most exciting developments in smartphone camera technology in recent years. Companies are working hard to come up with smart ways to

make it happen, like using special lenses and clever software. They're even putting more than one zoom camera in phones, and all this effort is paying off. Periscope zoom cameras, in particular, have emerged as the best way to get really good zoom on phones. Even if

those cool moon shots you see in ads are mostly done with AI, the new zoom cameras can zoom in better than before, catching small details you might not notice normally. Even if those advertised moon shots are mostly AI-regenerated, modern periscope zoom cameras can peak further than ever and are smart enough to catch details that may elude the naked eye.
