

the world. Educational institutes and professionals across the world have tried combating the use of AI, but failed. This is because OpenAI's own tool that they intended to use to identify AI-generated content was not able to work well, and they took it down. So, what now? Well, instead of playing a game of whack a mole with AI content, teachers have adapted make it their own best friend.

Students across the globe are being assigned work that requires them to critically analyse the output given by ChatGPT on a certain topic and come up with their own thesis on the same. For example, teachers assign students to write an essay on the impact of AI. Students go and generate it using ChatGPT. Now, the assignment does not end there. The students are required to now assess the content that AI-generated and then identify the critical points that it missed or the arguments that it put forth, and whether they align the thoughts of the student on that topic or not. If not, the student has to reason why.

Now, this is one way, in which AI is being used by teachers to their own advantage. There have also been teachers, not only at the school level, but also at colleges and universities, that have been using ChatGPT and other AI models and tools for their own purposes. For example, I have seen many teachers mention that tools like Scholarcy are being used by them to analyse research papers and get summaries which they in turn use to prepare for their own research or lectures.

The best way in the world of education seems to be to not weed out AI from campuses but rather innovatively embrace it.

HITTING THE RIGHT NOTES

AI and art have been at loggerheads for some time now. Be it AI generating images or making music, the artist community has been split between making use of it or standing up in arms against it. There is a lot of debate around the use of AI in the world of art. I as a writer, and someone who is interested in poetry would say, that if used smartly, AI has

the potential to help artists grow and create better content for their patrons and attract new ones as well.

While using AI in generating images and music is up for debate, because of the very fact that the data that these generative AI models train on is from the people who are actually bringing their imagination to life. However, if an artist is looking to grow their presence and send their content out to larger audiences, they can use AI tools to their advantage by putting it to work to enhance their social media presence. They can use it to their advantage as the teachers did by showcasing the differences between AI-generated art and their own work. There are ways in which AI can be used, and keeping an open mind about it is something that is very important.

IN THE FARMS

Agritech is revolutionising the traditional methods of farming and cultivation by integrating artificial intelligence (AI) for higher yield, efficiency, sustainability, and profitability. This advanced technology is not only employed in horticulture and agriculture but also in forestry, aquaculture, and viticulture. AI plays a crucial role in conserving the planet and its ecosystem by detecting plant diseases, pests, insects, locusts, and chemical fertilisers. It identifies malnourished farms, and parched lands needing

irrigation and determines the need for treatment with fertilisers or pesticides.

AI also aids in predicting seasons suitable for sowing and harvesting and incorporates innovative techniques like vertical agriculture to increase output while reducing the use of exhaustive natural resources. The new generation of educated farmers is more accustomed to modern machines and AI-aided technology, preferring to combine traditional land tilling with technology. The goal is to ensure that whether you buy veggies and fruits from online supermarkets or physical grocery stores, the produce retains its freshness and nutritional value from the field to the dining table. Practices like growing greens and animal husbandry have become norms to maintain biodiversity. Hybrid vegetables, organic farming, kitchen gardening, hydroponic plants, and space crops in zero gravity are some of the areas where AI is being utilised, all aimed at reaping the best returns from Mother Nature's bountiful gifts.

CONSUMER TECH

As I prefaced earlier in the article, there have been ways in which consumer tech has embraced AI, which we would have never thought before. To give you a better understanding of the same, flip the page and you will get an idea of the ways in which AI has made inroads into -ur tech. Beware, it might scare you –
