CHARTING THE COURSE OF AI INNOVATIONS FROM AROUND THE WORLD

[Must Reads]

Google doesn't want you to share confidential information with Gemini AI

Google has been breaking the AI news like anything for the past few months. The tech giant recently announced the renaming of its chatbot Bard to Gemini. After that, the Gemini Advanced came into the picture with more advanced configurations. It runs on Google's most powerful AI model, the Gemini Ultra 1.0 LLM. However, this time, Google is warning us about its AI. But why?

A support document posted by Google reveals that some conversations between Gemini and users go to Google's human reviewers. The company states that it sends the data to improve the quality and product itself.

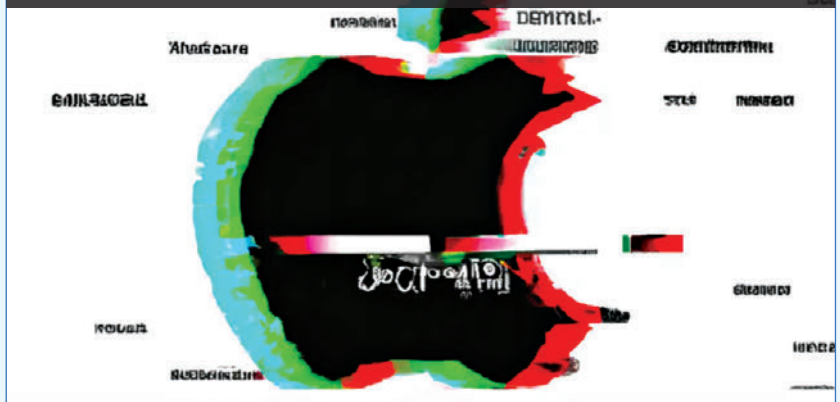

Furthermore, Google also says that only a small amount of information goes to human reviewers. The personal information of users such as email, phone number, etc stays safe. Unfortunately, you can't see or operate Gemini's activity. By default, Google saves Gemini's data for up to 72 hours. Again, to improve the quality and product.

Generally, Google stores Gemini users' data such as conversations, location, feedback, and usage information.

Apple MGIE

With this AI tool, you can do profession-level editing like cropping, resizing, rotating, adding filters, etc. The AI tool also allows for global optimisation that includes adjusting the brightness, contrast, and more. Editing here is super easy too. You just have to simply type in your prompt. <https://bit.ly/3SNY1iQ>

Meta-owned social networking platform Instagram is reportedly planning to introduce a new feature called "Write with AI". As the name suggests, this feature will likely enable users to compose messages with the help of artificial intel-

ligence (AI). Mobile developer Alessandro Paluzzi posted on X (formerly known as Twitter), "#Instagram is working on the ability to write a message with #AI."

Paluzzi also shared a screenshot of the feature that shows an option to "Write with AI" when messaging another user.

According to the mobile developer, this upcoming feature is expected to paraphrase your message in different styles, similar to how Google's Magic Compose works. Apart from these details, no other information has been revealed.

In related news, Meta recently announced that it will soon start labeling AI-generated images on Facebook, Instagram and Threads.
