

Acer Swift Go 14

Acer Swift Go 14 has been finally launched in India. The brand first announced this laptop during the CES 2024 in Las Vegas. What's special about this laptop is that it comes with a ton of AI features. Moreover, it is powered by the Intel Core Ultra processors and Intel AI Boost. The Swift Go 14 comes with AI features such as Acer AlterView, Acer AI Zone, Microsoft Copilot in Windows, and more. <https://bit.ly/3Su2xTl>

Google rolls out Gemini AI app globally

Gemini is a multimodal AI model from Google. Google has started to roll out its Gemini App for users in India. For iOS, the Gemini feature is available for those using iOS 16 and above. The app was first launched for users in the US on February 8, 2024, and is now being released across 150 countries and territories. <https://bit.ly/48nBU8v>

OpenAI releases Sora

All you need to know about this latest video generation AI model. Will it be the base of the next big Hollywood hit? Who knows?

—By **Satvik Pandey**

OpenAI has released some of the most popular AI models we have seen so far. Joining ChatGPT and Dall-E in the company's suite of generative AI is Sora, "an AI model that can create realistic and imaginative scenes from text instructions." OpenAI's model improves on the shortcomings of other models like Runway AI that launched in April 2023. The arrival of an AI model with the capabilities as vast as that of Sora, brings in a ton of questions that will need to be answered, especially around the safety of this model. So, let's have a look at some of the videos that demonstrate the capabilities of this model, and how OpenAI is making an active effort to combat misuse of a model like this.

After announcing the launch of the model, OpenAI published a bunch of videos on their website, <https://openai.com/sora>, demonstrating the capabilities of OpenAI's Sora. Sam Altman, the CEO of OpenAI after announcing the release of the model, also put out a Tweet asking people to send in prompts to generate videos, and the videos that were generated took me and others on

the internet, back by surprise. Have a look at some of the videos posted by Altman on his Twitter timeline generated using Sora.

The first thing that would come to your mind after looking at these Hollywood-esque videos would be the myriad of safety concerns that surround

a model like Sora. We have seen generative AI models in the past being used in all sort of ways. However, with a model as capable as this, OpenAI has ensured that they are taking all the precautions necessary from the get go.

First off, as it is with any AI model, the access of Sora is limited at the time of launch. The company also mentioned in its release blog, that they are actively working to conduct tests that will focus on ensuring that the most critical scenarios around this product are put

to test. They said, "We are working with red teamers – domain experts in areas like misinformation, hateful content, and bias – who will be adversarially testing the model."

The checks that are in place, will be done at multiple levels by OpenAI. In addition to the checks done on the prompts they will also be doing checks on every frame of the video that has been generated using Sora. They added, "We've also developed robust image classifiers that are used to review

the frames of every video generated to help ensure that it adheres to our usage policies, before it's shown to the user."

With the release of Sora, OpenAI has the experience of dealing with adversaries trying to game the model, having faced the brunt

of the misuse of its earlier models like ChatGPT and Dall-E. All these models have become smarter in rejecting queries that push their boundaries of safety and security concerns. Not only that, they have also gotten better at what they do.

So, the road ahead for Sora also looks the same, with the only difference being that this time, the bumps along the seem that they'd be avoided better than they were in the past. All we can do is wait and hope for the best.
