

Vivo X100 Pro

Unleashes the photographer in you

The Vivo X100 Pro is the company's latest camera sensation and comes with a lot of things that we found missing on last year's Vivo X90 Pro. Across publications, YouTubers, influencers, the opinion about the device is unanimous. That is a rare phenomenon in the tech industry and if this is happening, then of course, the brand has got it right. Let's get into it in a bit more detail.

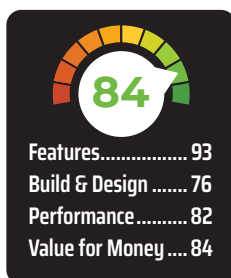

DESIGN

One of the very few things that I personally didn't like about the Vivo X100 Pro is the design. The smartphone doesn't look and feel as premium as the last two X-series flagships from Vivo. While it is obvious that crunching all that tech inside a 6.8-inch package will make things big and bulky, it is tough to ignore just how premium and superior the Vivo X90 Pro felt with the leather back and chrome accents. But well, like the most fun games aren't the best in terms of graphics, this isn't the best in terms of how it looks.

We get a huge round camera module that takes up most of the top part of the back panel, which is made of the frosted AG glass that we have seen with previous Vivo smartphones. The back panel doesn't have anything special going for it. The camera module, although too big, does give this smartphone its own distinct look among the crowd of smartphones. I, personally, don't like the frosted glass back on smartphones due to the slippery grip. The frame on the Vivo X100 Pro is a metal frame, which adds to the premium-ness of the smartphone.

Up front also, we get the tried-and-tested hole punch curved display. The curved display implementation is better in terms of looking premium and having less bezels, but it also leads to a lot of

₹89,999

accidental touches and makes the smartphone feel more fragile. Keeping both these aside, the front panel of the Vivo X100 Pro has a tried and tested design.

DISPLAY

Coming to the display, we get a 6.78-inch curved

AMOLED display with a 120Hz refresh rate. There is also LTPO tech, which means that the 120Hz refresh rate is adaptive and can adjust according to the content on screen. This time around, we don't get a UHD resolution. Instead, the Vivo X100 Pro sticks to an FHD+ resolution. However, the doesn't matter much since the display is as sharp as any other display out there and most of the content we see on our smartphones is anyways in 1080p, while this smartphone supports 1260p so we are comfortably safe there.

PERFORMANCE

In terms of performance, this smartphone is again supreme. This is the first device to come with MediaTek's latest flagship chip, the MediaTek Dimensity 9300, paired with 16GB of RAM,

which is double than that of the laptop I am writing this review on. This, itself should be enough to give you an idea of the performance of the Vivo X100 Pro. However, we'll talk a little more about it. My experience of using the Vivo X100 Pro has been nothing short of super fast and slick. The smartphone is amazing in terms of switching apps, having multiple apps running in the background, and even gaming.

During normal usage, this smartphone obviously has enough power that you will never be left asking for more. Swiping through multiple apps or running multiple apps at once is buttery smooth on this smartphone. Furthermore, I also ran some high-power apps like Adobe Lightroom for editing photos or VLO Studio for editing videos and as expected, the Vivo X100 Pro ran all of these like it's nothing.

For the sake of it, let's mention synthetic benchmarks. In our tests, the Vivo X100 Pro put up a higher score on AnTuTu as compared to the iQOO 12, which comes with a Qualcomm Snapdragon 8 Gen 3 chip. In other CPU-based benchmarks also, the Vivo X100 Pro, powered by the Dimensity 9300 chip was at par with the Snapdragon 8 Gen 3-powered iQOO 12. At times, it even beat the Snapdragon 8 Gen 3-powered smartphone.

In GPU benchmarks also, the Vivo X100 Pro was right up there with the only Snapdragon 8 Gen 3-powered smartphone that I have tested so far. The smartphone runs games smoothly on the highest-possible settings and for a long duration at the same time. I played games like Call of Duty: Mobile, Battlegrounds Mobile India, or even games like Cricket 24 or Asphalt 9 Legends and the experience was as good as I have personally experienced on a mobile device.

The Vivo X100 Pro doesn't even throttle on heating. The smartphone throttled to 78 percent of its performance on heating, which is pretty good for any smartphone out there. And while we are at it, the heating is minimal. Even during performance-intensive tasks like gaming or recording videos, the smartphone
