

INFINIX Y4 MAX PERFORMANCE REVIEW

I have the Intel Core i3-1315U CPU variant of the Infinix Y4 Max and I think this is the one a lot of people are especially going to gravitate towards. Mainly because the immediate next Intel 13th Gen Core i5 variant of this laptop costs Rs 7000 more. For that price, you are only getting an upgraded CPU meanwhile the rest of the specs remain identical. Thus, easily making the Core i3 variant potentially the most value-for-money one and here's how it performs.

In Cinebench R23, the Infinix Y4 Max scored 4828 and 1649 points in multi-core and single-core tests respectively. Meanwhile, in the Cinebench R23 throttle test, the Y4 Max lost around 200 points, which, in my experience, indicates that the laptop isn't losing much performance under sustained load. Usually, the point difference between a normal run and a throttle run should be around 300-500 points to be considered normal. The best thing is that the Intel Core i3-1315U can easily stretch its legs and continue to run at its default TDP of 15W continuously for 30 minutes.

Next up is Geekbench 6 and in that test the laptop scored 2305 and 7475 points in single and multicore runs respectively. From these two tests, it is evident that the Y4 Max's single-core performance is great while its multi-core performance is decent. And that's what we see in real-world usage. The laptop is great at handling multiple Chrome tabs, a bit of graphic design in Canva and 4K video streaming. Anything more than that like running AAA games or video editing and the laptops will begin to struggle.

The 512GB SSD onboard is the same that's present across all the variants and it has decent read and write speed. Specifically, it has 3472.04 and 2546.58 MB/s read and write speed respectively. To put it into perspective, the SSD boots up the Y4 Max in 13 seconds, which is pretty fast.

The onboard 16GB LPDDR4X RAM operates at a clock speed of 4567MHz,

making it very fast and the highest speed supported by the Core i3-1315U processor, for LPDDR4X RAM type. Although this LPDDR4X format offers significant advantages in terms of RAM speed, it falls short in terms of upgradeability. This limitation stems from the fact that LPDDR4X RAM is soldered directly onto the motherboard, making it impossible to upgrade in the future.

INFINIX Y4 MAX REVIEW: CONCLUSIONS

The Infinix Y4 Max checks so many boxes that it is going to become my default recommendation for laptops under Rs 35,000, for a few months at least. It nails down the important basics like good build quality, a great display, and a healthy I/O so well that legacy brands need to take note of it. On top of that, the sweet combination of 16GB RAM and 512GB SSD from the base variant further boosts the value

quotient of an already affordable Windows laptop. In many places, the laptop delivers more than expected while in others it performs exactly how its specifications suggest but it doesn't disappoint you in any major way. Infinix Y4 Max is easily the best laptop under Rs 35,000 for anyone looking for an office/work laptop or a Windows PC for home/education purposes.
