

Android or iOS. This question has been asked and answered in many ways over the past 15 years of both operating systems' existence, but which one is actually better? Well, in their own ways, both Android and iOS have their distinct advantages and disadvantages. And apart from the overdone competition about which one is better, there have also been lawsuits and accusations about Google copying Apple's idea or vice versa. The truth is, over the last 15 years, both Android and iOS mobile operating systems have taken inspiration from each other on several occasions, and both have their own set of what one does better and what the other.

So the idea of this article is simple. We will compare a few features and functionalities on both the mobile operating systems and figure out if Android or iOS do it better. Let's begin.

MULTITASKING

With smartphones being the center of our ecosystems, multitasking becomes all the more important. Now, it is no secret that Apple's iPhones are superior in terms of performance and just the amount of stuff that iPhones are capable of handling. However, all of that takes a back seat when it comes to multi-tasking, since Android allows users to open many more apps with the option of using split-screen, picture-in-picture, opening multiple windows for apps, and a lot more.

Apple iPhones, on the other hand, do not offer any such option. While multi-tasking is smooth here as well, most of it is limited to how quickly you can switch between one app and another.

We don't get any option to use split screen, or open multiple windows like we have seen on Samsung's OneUI, which allows users to open as many apps as possible on their phone screens. And even though Apple offers picture-
