

Will AI-powered robots assemble next-gen Mercedes?

With AI seeing a significant boom in the tech sector, it seems like humanoids could be the next big thing. In the last couple of months, we have seen AI-powered robots surfacing from various companies. Now, Apptronik, an Austin-based robotics startup, has announced a partnership with Mercedes-Benz. This collaboration could mean big things and has signaled that the automaker could be integrating advanced robotics into the Mercedes-Benz Manufacturing processes. <https://bit.ly/3Vp1Ldx>

Apple acquires DarwinAI

Most of the leading tech companies have jumped on board with the AI trend, with everyone trying to come up with something better than the other. But for a while, Apple has shied away from jumping on the trend.

But now it seems that Apple has decided to go with the “better late than never” formula and has started to give its due attention. News on the block is that Apple has acquired Canada-based DarwinAI for device AI to further its AI game. Read along as we share what’s happening here. <https://bit.ly/3VMfewj>

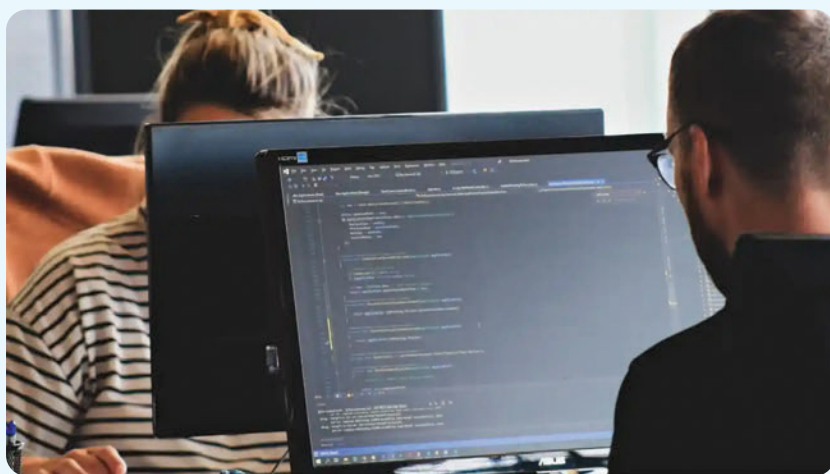

Indian govt issues self-regulating guidelines for AI developers

MeitY has asked developers to seek approval from the Government of India before releasing them for public use

—By **Mustafa Khan**

With the world seeing an AI boom and the negatives of the same surfacing online too, governments are becoming more vigilant about the rules that regulate this new technology. Previously, the Ministry of Electronics and Information Technology (MeitY) had asked AI developers who were still under work to seek approval from the Government of India before releasing them for public use. In a welcome move for AI developers, the Indian government has updated its guidelines in a significant policy shift. The new policy now allows developers to release generative AI models without prior government approval.

This updated policy was announced on March 15. Instead of the previous requirements, the updated advisory has asked developers to undertake the

process of self-regulation and to take proactive measures for the challenges that are arising.

With this, the government is trying to balance promoting the development of technology and mitigating potential risks associated with AI. Further, the government has urged AI developers to add labels to the output of their models, particularly those prone to

misuse, such as deepfakes. They should properly label if any content that is produced by AI is unreliable. Speaking of deepfakes, the government requires developers to label or embed such content with unique metadata. If they fail to comply with these regulations then it may result in prosecution under existing laws.
