

colour-accurate presets are cinema mode and filmmaker mode with a white point close to D65.

The nanocell display is capable of reproducing a wide colour gamut. As indicated by the CIE LAB results above, the colour volume this QNED Panel can reproduce is similar to what we get with QLED displays. We recorded up to 99.8% RGB coverage and 94.9% DCI P3 coverage.

LG has done a great job with screen uniformity. In SDR mode, the skin tones look natural. The TV does well when it comes to the bright SDR sequences. In dark SDR scenes, we noticed that black and light grey details were not great, but overall the TV did better than expected when compared to most other LED LCD TVs that we have tested.

In our colour checker test, the LG QNED 83 performed really well. We recorded an average Delta error of 3 with occasionally a colour exceeding 4. What this means is that colours are perceptibly accurate. LG QNED 83 does a great job of upscaling legacy content. If you like mild motion smoothing, you can switch from Filmmaker mode to Cinema mode.

When it comes to HDR, this TV supports Dolby Vision, HDR10, and HLG. We recorded a peak brightness of 849 nits (vivid mode) and a BT2020 colour coverage of 70% in UV terms (HDR content is mastered for DCI-P3 colours in the BT2020 container). For a better perspective, these stats are comparable to higher-midrange QLED TVs.

In the filmmaker mode, the TV tracks EOTF curve rather faithfully which means the TV will properly brighten or darken different scenes in line with the creator's intent. In our HDR colour checker test, we recorded an average delta of under 3.0 without any calibration, which is excellent. Once again the TV does really well in Bright and mixed APL HDR sequences. Skin tones are natural and there are sufficient details in the highlight.

In excessively dark HDR scenes, blacks feel muddy and we were left wanting for slightly more contrast. If you are watching content prominent with dark scenes like See on Apple TV, you can turn local dimming to High and get better contrast. But

this works best if you have the subtitles turned off. By default, the local dimming is set to low and it does a good job of masking IPS glare but at the expense of some noticeable blooming.

The 20W speakers with Dolby Atmos offer wide soundstage and decent dialogue clarity. But for a truly immersive experience, you will need to invest in a soundbar.

PERFORMANCE AND WEBOOS

All picture processing is handled by the 6th generation $\alpha 7$ AI Processor 4K. This is a mid-tier chip in LG's lineup and it is paired with 8 GB storage, 5.68 GB of which is available to end users. UI transitions are reasonably smooth. AI features like AI Picture Pro and AI Sound Pro are supported. The interface is intuitive and we could easily find the options that we were looking for. The quick settings menu overlay makes it convenient to switch picture mode and audio mode when the content is playing. We didn't face any issues casting from popular apps on our phones to the TV or mirroring the phone screen.

The TV supports Apple AirPlay 2 and HomeKit. WebOS makes it easier to remotely connect and access other devices like your PC or your browser. The LG voice assistant can't quite match up to the dexterity of Alexa or Google Assistant when it comes to looking up content. LG provides a dedicated key for Alexa which works by activating the LG TV skill on your Amazon account. Once set, you can press the Alexa button to use Alexa's voice commands to open apps, search content or operate smart home devices.

GAMING

There is a lot here for gamers. The 120Hz display is quite responsive. LG includes HDMI 2.1 ports, support for ALLM, VRR, and also the HGIG mode for accurate tone mapping in HDR games.

We played games like Witcher 3, Fortnite, and Spiderman Miles Morales on PS 5 and the overall experience was really enjoyable. There was no hint of screen tearing in the gaming mode. The HDR impact wasn't as well pronounced as on the LG G3, but it still delivered a pretty good experience.

SHOULD YOU BUY IT?

So to sum it up, the LG QNED 83 is a very interesting LED LCD TV. It performs really well in bright sequences and delivers a clean picture quality. The QNED display supports a wide colour gamut and reproduces accurate colours in HDR and SDR content. The software is easy to navigate and integrates a colour-accurate filmmaker mode for enthusiasts. And the gaming experience is also really enjoyable.

Where the TV struggles is with dark HDR scenes where blacks feel muddy and some blooming is apparent with the edge-lit local dimming.

The major plus point is the wide-viewing angles of the IPS LCD panel, which does make a difference. So, if you are hesitant about OLED TVs and are looking for a capable LED LCD TV for primarily viewing in a bright living room, we can recommend the LG QNED 83 as an option.

The TV's maximum retail price (MRP) in India is listed at 1,59,999, but it's actually available for much less. At Chroma, the 2024 model is currently priced at Rs. 94,990. This is still a little pricey for a 55-inch TV, but with additional discounts during festival seasons, this could turn out to be a good deal, so it's worth keeping an eye on. As for alternatives, you may also consider last-gen Samsung Neo QLED options like the Samsung QN85B which offers a QLED display with a mini-LED backlight in the same budget.
