

compared to the recently launched RTX 40-series Super cards, the AMD Radeon RX 7900 GRE goes toe-to-toe with the RTX 4070 Super but is usually lagging behind by a few FPS.

In Cyberpunk 2077, the 7900 GRE gives a little more than 140 FPS at 1080p but at 1440p, it drops to about 90 and at 4K, it becomes about 40 FPS. With ray tracing switched on, the 7900 GRE churns out a little under 50 FPS at 1080p and that drops down to about 15 FPS at 4K. So you will need to scale down the ray tracing configuration on the 7900 GRE to get playable numbers. F1 23 gets about 220 FPS without ray tracing at 1080p, 185 FPS at 1440p and that goes down to about 120 FPS at 4K.

Once you switch on ray tracing, the 1080p FPS drops to about 90 FPS, a little over 60 FPS at 1440p and at 4K it becomes unplayable. For most games, you should be able to get playable frame rates at 1440p but 4K becomes a little difficult, especially with ray tracing switched on.

POWER CONSUMPTION AND TEMPERATURES

Power consumption on the 7900 GRE is pretty power efficient and consumes around 260 Watts at peak load. Even the temperatures at peak load are within normal levels. We saw the GPU hit about 70 degrees Celsius which is a huge improvement compared to older

generations where the GPUs would easily cross 85 degrees.

VERDICT

The Sapphire Radeon RX 7900 GRE is a good graphics card for gaming at 1440p with plenty of performance headroom for a few years. It does better than the RX 6800 XT from the previous generation and goes toe-to-toe with the RTX 4070 Super. We don't have the official Indian pricing for the 7900 GRE but we did spot some listings for INR 70,500 which seems a little higher considering that the RTX 4070 Super, which is as good in raster gaming and better in ray tracing-enabled gaming, costs INR 63,000. To be cost-effective, that's the max that this card should sell for to be a great 1440p gaming graphics card.
