

Noise Luna Ring

Over the moon or just white noise?

Ali Akbar Merchant

Let me be honest, I have been putting off writing the review for the Noise Luna Ring for a long time. Initially, I was quite excited to check out the new wearable form-factor and put it through its paces. After the initial few days of use, it ended up being quite underwhelming as the battery life was not great, the charging indicator was not particularly consistent, and the app lacked polish. So as intrigued as I was with the Noise Luna Ring and the hardware it packed into its slim and petite package, I had to wait a while for the experience to improve.

And thankfully it has finally reached that stage. So has it improved? Well, it's still not perfect but at least I can review it without wanting to pull my hair out. Needless to say, that should be a basic benchmark for a device that is advertised to help track or improve your health.

Build & design

Like the heavenly body, the Noise Luna Ring is named after, the design and build is an area where the Luna Ring truly shines. In terms of its looks, it is as subtle as a basic band-type ring. Nobody is going to suspect that it is anything more than normal jewellery. Even for me, a guy with rather slim and spindly fingers, the Luna Ring fits fine with absolutely no feeling of bulk. Just make sure to pick the correct size though. The Luna ring is available in seven different sizes and when you place an order you receive a sizing box with several mock Luna Rings in different sizes. Try them on, wear them for a day and pick the one that fits you best.

The materials used are pretty premium as well. The outer side is made using titanium, and on the inside (the side that touches your skin) is made from a type of plastic that is hypoallergenic to prevent skin irritation. The inner shell is also transparent so you can see all the sensors and inner workings of the ring.

The inner shell has three bumps, each of which houses a sensor. We'll talk more about the sensors in a while. The bumps being on one side of the ring help with aligning the ring on the charging puck. However, we did notice that the ring would slide onto the puck in ways that did not align with the charging coils. So if you didn't pay attention to the little bumps, then you might plop the ring onto the puck the wrong way at night and wake up to a completely discharged ring in the morning. The key to figuring out whether you've placed the ring onto the charging puck properly is to see if the Noise logo in the centre of the puck lights up and pulses slowly.

You'd assume that a ring with a couple of sensors and a battery of its own might weigh quite a bit, but that's where I was pleasantly surprised. At 3-to-4 grams (depending on the size), you can barely feel the ring on your finger. And if you do manage to drop it, it can handle a few falls.

Lastly, if you're one to be a little concerned about the aesthetics, then you get a few options to pick from between colour options (Stardust Silver, Midnight Black, Lunar Black, Rose Gold and Sunlit Gold) and finishes (glossy and matte). There's not much other than colour options and finishes. The design is the same across all the rings and it's quite simple. There's a protruding diagonal crease that spans from one edge to the other. Simple.

Features and sensors - Sauron might get jealous

This tiny and subtle ring packs in a surprising number of sensors. A few years ago, not even full-blown smartwatches and fitness trackers had some of these features. So let's get the hardware out of the way first.

In terms of the sensors, the Luna Ring has an optical heart rate sensor, blood oxygen (SpO2) sensor, skin temperature sensor, a 3-axis accelerometer and an infrared photoplethysmography (PPG) sensor. I even know what that last one means, now that I have Googled it. From what I understand, the PPG sensor is used to provide a secondary reading for heart rate and blood oxygen
