

What are the biggest cybersecurity threats today?

JAYDEEP SINGH
KASPERSKY

According to the data from our Kaspersky Security Network (KSN) around 33% of web users in India have faced cyberthreats in one form or another. Threat techniques like phishing, ransomware, malware, social engineering are increasingly being used by the cybercrooks in India. Research done by our experts also showed that ransomware incidents have risen dramatically over the past year, in complexity, targeting financial institutions, e-commerce platforms, and government agencies.

ANAND JETHALIA
MICROSOFT

In the past year, there has been a rise in cyber threats from cybercriminals and nation-state attackers, posing serious risks to global security and stability. To address these challenges head-on, Microsoft has launched the Secure Future Initiative (SFI). While effective cyber hygiene practices have proven successful in defending against most cyberattacks, well-resourced attackers are increasingly becoming sophisticated and aggressive, targeting critical infrastructure such as power grids, water systems, and healthcare facilities.

VISHAL SALVI
QUICK HEAL

Ransomware attacks remain a dominant force, and there is a worrying shift in their occurrence. While individual incidents are less frequent, the overall volume of malware detections has risen significantly. Removable media, once considered a fading threat, has seen a resurgence. Over half of all detections our researchers at Seqrite Labs made, originated from removable drives. Phishing attacks, remain persistent.

HARISH KUMAR GS
CHECK POINT

The cyber threat landscape is advancing rapidly marked by AI-enabled malware, Deepfakes and voice cloning. Ransomware remains a major concern for businesses, evolving into doubt extortion attacks, encrypting data and stealing sensitive information. Mobile devices are increasingly targeted with malicious software disguised as legitimate apps, infiltrating corporate networks easily.

PARAG KHURANA
BARRACUDA NETWORKS

The end goal of cyberattacks hasn't evolved much over the past year; what has evolved, however, are the scale, severity and sophistication of these attacks and the techniques used by attackers. As companies become increasingly digital, attackers' routes into and through a target have adapted to take advantage of the ever-expanding attack surface. Email-borne threats remain dominant.
