

How is AI helping improve cybersecurity everywhere?

**ANAND

MICROSOFT

AI is scrutinising vast datasets to identify organisational activity patterns, from user logins to network traffic, bolstering privacy with global threat intelligence. On the other hand, machine learning aids in recognising and contextualising threats like malware. While human expertise remains crucial, AI enhances skills and accelerates threat detection and resolution in a big way. Responsible integration of generative AI into security solutions is essential to uphold privacy, reliability, and safety standards.

We are going to see AI tools and machine learning will be a cause of concern in cyberattacks. Even as these tools help the cybercriminals, our experts say that AI tools can be used for defensive applications against major threats. One of the ways to do this is to enable AI assistants for cybersecurity specialists to fight crime. We expect the red teams and cybersecurity experts can leverage generative AI for innovative cybersecurity tools, which can lead to a cyber assistant using LLM or ML.

Advancements in AI and ML are revolutionising cybersecurity defences. AI enables real-time analysis of vast data sets, swiftly identifying and mitigating evolving threats. Meanwhile, machine learning algorithms can predict future threats by analysing past attack patterns and subtle indicators of compromise, strengthening proactive defence measures. These technologies automate response actions, such as isolating infected devices, minimising damage, and allowing security teams to focus on recovery efforts.

AI is enhancing cybersecurity in several ways. For example, intelligent AI-driven email security can identify known phishing patterns, spot unknown threats, and use natural language processing to analyse content for sentiment, context, tone, and potential malicious intent.

CHECK POINT

AI and ML significantly shape cybersecurity defence by automating repetitive tasks, enhancing threat detection and response, improving situational awareness, and aiding in end-point, network, cloud security, and fraud detection.
