

How to reduce human error in cybersecurity risk?

HARISH KUMAR GS
CHECK POINT

Human errors, such as falling for phishing emails or using weak passwords, can be minimised with proper training and a culture of security. Implementing a Zero Trust strategy is crucial, ensuring only authorised personnel access sensitive data. Technological aids like two-factor authentication and automated security protocols compensate for human weaknesses. AI and ML tools help.

VISHAL SALVI
QUICK HEAL

Human error is frequently identified as a weak point in cybersecurity, and addressing it effectively is crucial. One strategy is regular training, which educates individuals on current threats and best practices for secure online behaviour. Engaging tutorials on identifying phishing attempts, maintaining strong passwords, and safe browsing habits can empower users to make informed decisions and avoid common scams.

BARRACUDA NETWORKS

People will always make mistakes. The best way to reduce risk is with defence-in-depth cybersecurity. This should feature robust access and authentication controls, ideally based around Zero Trust, network segmentation, application security and other measures to detect, prevent and block suspicious activity across the entire IT estate. This needs to be supported with regular, engaging, and user awareness training.

JAYDEEP SINGH
KASPERSKY

In India, around 24% of cyber incidents against businesses occurred due to employees intentionally violating security protocol. External hacking is just 33% of the time, as issues like weak passwords, failure to change them frequently etc. enabled cyberattacks. In addition, our research found that nearly 3-in-5 cybersecurity breaches were the result of staff in India visiting unsecured websites. Only when there is a high level of awareness will it be possible to reduce cyber threat incidents due to human error.

ANAND JETHALIA
MICROSOFT

We recently announced that Microsoft Copilot for Security will be generally available worldwide on April 1, 2024. The industry's first generative AI solution will help security and IT professionals catch what others miss, move faster, and strengthen team expertise. Copilot is informed by large-scale data and threat intelligence, including more than 78 trillion security signals processed by Microsoft each day, and coupled with large language models to deliver tailored insights and guide next steps.
