

10 WAYS YOU DIDN'T KNOW YOU CAN GET HACKED!

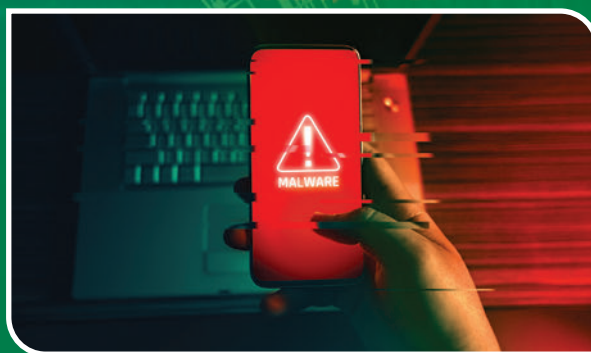

YOU DON'T KNOW WHERE THE THREAT IS

Satvik Pandey | satvik@digit.in

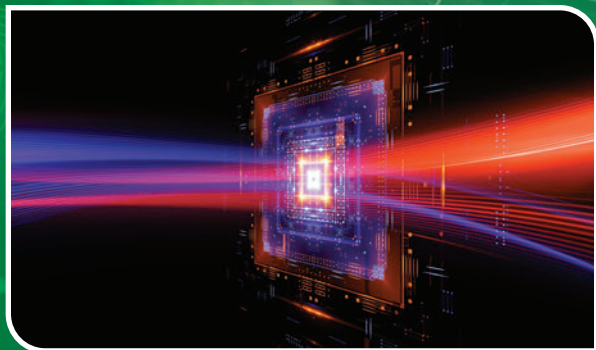

In the ever-evolving landscape of cyber threats, hackers are constantly devising new ways to infiltrate systems. Here are ten advanced hacking techniques that you should protect yourself from in 2024:

AI-Powered Attacks: With the rise of AI, hackers have started using machine learning algorithms to automate attacks, making them more efficient and harder to detect. These AI models can learn from past cyber-attack patterns and predict future ones, making them a formidable tool in a hacker's arsenal.

5G Network Exploits: As 5G networks become more prevalent, they also become a target for hackers. Vulnerabilities in 5G infrastructure can be exploited to intercept data or launch DDoS attacks. The high-speed and low-latency nature of 5G networks make them an attractive target for cybercriminals.

Quantum Hacking: As quantum computing becomes more accessible, so does the threat of quantum hacking. This involves exploiting the principles of quantum mechanics to crack encryption keys and secure communications. Quantum computers can process information at an exponentially faster rate than traditional computers, making them a significant threat to cybersecurity.

Supply Chain Attacks: Hackers are increasingly targeting the supply chain of software development. By injecting malicious code into trusted software packages, they can compromise systems when these packages are installed. This method is particularly insidious as it exploits the trust between software providers and their customers.
