Airchat: New audio-based social media app is here

If Clubhouse and X (formerly known as Twitter) had a child, it would be called Airchat. No, I we not making this up. Airchat is the latest buzz and an invite-only social media platform. What's so unique about it? Well, unlike other social media platforms, it is audio-based. I guess the founders were highly impressed by podcasts, that's why they came up with this. Speaking of founders, Airchat is the brainchild of AngelList founder Naval Ravikant and Tinder co-founder Brian Norgard.

So for us to understand better, Airchat is very similar to X. The difference here is that instead of it being image or text-based, it is audio-based. Like we post text, images, and videos on

X, we can post audio notes here. With every post, you get a transcribed text too. Users can choose if they want to listen to the audio or just read the transcription. To post something, simply click on the microphone button and begin recording the audio. You will get real-time transcription along with the audio. Users can even reply to your posts with an audio note. <https://bit.ly/3WsgeWm>

WhatsApp could soon let you share photos & videos without internet connection

In a world where staying connected is key, Meta-owned WhatsApp is gearing up to revolutionise how we share moments with our loved ones. Imagine being able to share photos and videos even without an internet connection. Yes, you read that right! WhatsApp is reportedly working on a groundbreaking feature called 'People Nearby' that could change the way we share media. This feature aims

to enable users to effortlessly share media content with those around them, eliminating the need for an internet connection. <https://bit.ly/4bjbffc>

Horizon OS combines social media features in MR

After its many recent stints, like Meta AI for example, it has now unveiled the Meta Horizon OS. How is it different from other mixed reality tech? What Meta is doing differently from others is that it has combined mixed reality with social features, something that it specialises in. This is not something that Meta came up with out of the blue. It has been working on developing next-generation computing platforms for a while now. High-resolution Passthrough, Scene Understanding, and Spatial Anchors are some key features that Meta has focused on.

Global tech companies working with Meta Horizon OS

Have you ever wanted to quickly share something you see on your phone screen with a friend? Maybe it's a funny meme or an important detail on a website. Well, good news for Pixel users! Google's Circle to Search feature might soon get a cool upgrade that makes sharing screenshots on your phone a breeze. Google is reportedly gearing up to introduce a useful new feature for Circle to Search, which will likely enable Pixel users to effortlessly capture and share specific sections of their screen as images. This upcoming feature for Circle to Search was spotted by AssembleDebug, who tipped PiunikaWeb about the development. <https://bit.ly/3UhrBOV>

Meta opens Quest OS

Meta has announced that it is opening up the operating system powering its Meta Quest devices—Meta Horizon OS—to third-party hardware makers, giving more choice to consumers and a larger ecosystem for developers to build for. Also, the company has announced that it has partnered with Xbox to create a limited-edition Meta Quest. Meta has revealed that leading global technology companies are already working on new devices built on Meta Horizon OS. <https://bit.ly/3UA6w2Z>
