

Adobe Photoshop to get generative AI

Adobe has introduced the all-new Photoshop (beta), packed with exciting features to make image editing easier and more fun for

everyone. This update brings breakthrough advancements in Generative Fill now with Reference Image, giving creators more control and unleashing superpowers for all Photoshop users to create amazing images with confidence. The new features, powered by Adobe Firefly Image 3 Foundation Model, integrate powerful generative AI capabilities right into Photoshop workflows. <https://bit.ly/3UDwMte>

Google's AI weather predictor SEED is here!

The developments and advancements in the space of AI take us by storm daily. Every day some new development comes across

that we were not expecting at all. We are talking about Google's AI tool – SEED. It is a generative AI model that predicts weather. Google's AI tool SEED, which is short for Scalable Ensemble Envelope Diffusion Sampler, is being seen as a much-needed development in the space of weather forecasting.

Microsoft's new Phi-3-mini AI model will help companies with small budget

Phi-3-mini can be immediately accessed on Microsoft cloud service platform Azure's AI model catalog

—By **Mustafa Khan**

"All the major tech companies are in a fight with each other to win the AI race. God only knows when that will end. Now, Microsoft has launched a new light-weight AI model called Phi-3-mini. With this, Microsoft aims to broaden its client base by providing cost-effective solutions. This launch is a part of three small language models (SLMs). Let's find out more about these.

SLMs are language models specifically designed to take care of simpler tasks. This is more convenient for companies that have limited resources. Phi-3-mini will be pretty easy to access. It can be immediately accessed on Microsoft cloud service platform Azure's AI model catalog, machine learning model platform Hugging Face, and Ollama, a framework for running models on a local machine, as per Microsoft. In addition to this, it will also

be available on Nvidia's software tool Nvidia Inference Microservices (NIM). It is optimised for its graphic cards. This allows for efficient performance across different hardware environments.

Sébastien Bubeck, Microsoft's vice president of GenAI research, said, "Phi-3 is not slightly cheaper, it's dramatically cheaper, we're talking about a 10x cost difference compared to the other models out there with similar

capabilities." This development comes from Microsoft's strategic investment of \$1.5 billion in UAE-based AI firm G42, which underscores its commitment to expanding its global AI capabilities and partnerships. Notably, the company has previously collaborated with French startup Mistral AI to integrate its models into its Azure cloud computing platform, further bolstering its AI ecosystem."
