

Google vs Microsoft

Both ready to pitch in \$100 Billion on AI, here's why

—By **Mustafa Khan**

Artificial Intelligence is the way forward, and the leading tech players know it. That's the reason why all of these companies, be it Microsoft, Google, or any other, are not only putting in all the efforts but also the money to push forward their AI ambitions. It looks like they are in a constant race with each other. And I think that they think so too, which is interesting!

Now, in a recent TED conference held in Canada, Demis Hassabis, CEO of Google DeepMind, said that Google will eventually pitch in over \$100 billion in the advancement of artificial general intelligence (AGI).

This seems like Google's response to Microsoft's Stargate project. For the uninitiated, Microsoft recently announced its Stargate project. As per reports, Microsoft and OpenAI are currently in talks to develop a \$100 billion supercomputer project for artificial intelligence system training. This is called the "Frontier" system. It is said to

be the most powerful supercomputer in the world and is located in the United States. The construction of this alone cost around \$600 million.

Hassabis' remark is proof enough that Google has acknowledged what Microsoft and OpenAI are doing. It also shows that Google is not willing to share its plans but is willing to put in as much money as its competitor towards the goal. Seems like a classic tech-company Cold War plot.

Both of these companies are willing to put in all the effort and money because both of them want to become the first to create artificial general intelligence (AGI). As we have seen in ChatGPT's case, the first mover always has an advantage.

Apple's upcoming M4 chips for Mac to be loaded with AI

They are finally on board the AI-train

—By **Mustafa Khan**

Apple is pretty late to the AI party. While other competing tech companies are rushing to establish themselves as AI leaders in the market, there has been some silence on Apple's front. However, the word on the grapevine is that Apple might be going hard with AI with its upcoming devices and updates. A new report reveals that Apple will offer new AI features for its Mac lineup and is currently working on the next-generation M4 chips to bring that to life. Read for more details.

Mark Gurman, from Bloomberg, revealed that Apple is currently working on its next-generation M4 chipsets for

the Mac lineup. These new chips could be unveiled by late 2024. These chips will reportedly enhance performance and add AI features to the Macs to help compete with its competitors.

Now, if we keep in mind Apple's timeline, the California-based tech giant could launch the M4 lineup of chipsets in October this year. Why do I say that? See, last year Apple unveiled the M3, M3 Pro, and M3 Max chips in

October. So, if Apple follows this, then we will have new AI M4 chips in a couple of months. According to Gurman, the rollout can span from late 2024 into early 2025. According to him, the entire Mac lineup is slated for an M4 upgrade.

The initial updates can be launched for the iMac, various MacBook Pro models, and the Mac mini. Later, the MacBook Air can also receive the M4 upgrade by the spring of 2025, followed by the Mac Studio and Mac Pro.

It is expected that the M4 chips will come in three main variants: Donan for entry-level devices, Brava for mid-tier devices, and Hidra for top-tier devices like the Mac Pro. They will have a 3-nanometer architecture, which we previously saw in the M3 series.
