Digit: Currently, the big trend everywhere is AI. What kind of tasks or activities do end users want to do with AI? Have you identified any such unique AI-based needs that end users have had which have influenced the development of AI features that you have introduced in Lenovo laptops?

Leon Yu: Okay. What we see, okay. Founders of it, to be honest, we don't have that kind of details that what kind of things they want. But what we have generally is, is that more than 66% of people believe that within 3 to 5 years it will completely change their lives. Okay. Yeah. And then that will shorten their time in terms of and improve their profit. I think the productivity, that kind of thing. So that based on that, we think that we need to make sure our whole power line even maybe cater to that. Okay. So that I think what we have right now from the industry standard is more under adaptive AI, but not generative AI. Okay. But generative AI will create a major difference. So especially like in India, is very unique because a lot of YouTubers creators there, right? Yeah. So to make their life easier for content creation, that kind of thing, generative definitely

can help them to be more professional in their jobs. Right? So these are the things that we foresee and we are prepared for that.

Digit: As we know, like you said in the next 3 to 4 years, it's just going to dominate everything. How does Lenovo ensure that they stay on the leading edge of AI capabilities?

Leon Yu: Yeah. So to answer your question, I would request again that if you check currently on the market, which vendors have their own AI solution, you can consider

ourselves as one of the ISV individual solution providers, right? We need to transform ourselves because the majority of the vendors of PC even still focus on device production. But we already go beyond that from device maker to even solution provider. So that I think that is a key because so far, if we want to, you know, make sure that the end user will feel what's the benefit of AI? I think majority is still the software.

Digit: Would you say that as of right now, it gives you a more unique competitive advantage? The solutions that you currently have, like what about it would you say makes you stand out?

Leon Yu: It gives you a unique edge. India is a very big and important market. You know, that, in terms of the market size among Asia-Pacific, India is the biggest right now. Okay. Yeah. And the penetration is still very low. So for us is very, very important market that we need to penetrate. And then I think with that kind of innovation and the our own transformation that we have, that I think that can help us to stand out in the win. Finally, for the market competition, that is our goal.

Digit: What would you say are the benefits of having AI on the edge as opposed to like on the cloud?

Leon Yu: I think privacy, security are the most important because a lot of people don't want you when they talk about AI. They also have a concern if it's a cloud-based, then that means maybe my PC is no better than me. Then he would do something crazy that I don't know right? So from our side, the key is that everything is personal, more personalized and determined by the users. You decide whether you want to shoot or not, the control is, users, but not some kind of, you know, so that you'll be hassle-free for the user, then this is the most important part that we are a trusted and secure, vendors that everyone that you can count on.
