laptops, which can aid them in streamlining their assessment process. In that case, they can dedicate that time towards developing even more innovative methods of teaching or aiding in furthering the development of the pedagogy of their institute.

Challenges and concerns around using AI-powered laptops in academics

As they say, there are two sides of each coin. When we have the co[AI]n in our hands, especially when working with the topic of AI-powered laptops in academics, on one side, we have the countless ways in which AI-powered

laptops will help students and educators. However, on the other side, where we have ethical concerns and challenges around AI-powered laptops in academics, which we need to look at.

Digit's Managing Editor, Mithun Mohandas, in his editorial in the February 2023 issue of Digit Magazine, wrote about Hallucin[AI]tion, which refers to the phenomenon of an AI content generator giving information that is untrue or not present; it makes it up on its own. Mithun wrote, "The articles generated by AI models might sometimes come across as believable but might be completely made up with no actual basis backing it up." And,

this was based on his own experience using ChatGPT back then.

He also noted how AI-generated articles are seeing wider adoption by publishers across the world, and this would lead to factually inaccurate information being published, which in turn would be referred to by a generative AI, and this will start a never-ending virtuous cycle of inaccurate information being propagated.

Considering this is an issue that most AI-powered content generation tools suffer to this date, fact-checking the information that is being generated by these tools is more important than ever. Especially when we are looking at the use of AI-powered laptops in academics. Add to that, the biases that come with the content generated by AI tools and certain accessibility issues, you will get concerned. However, it is important to note here that AI for public use and AI-powered laptops in academics are in nascent stages and there is immense potential that they hold. So, until then, it will be up to the stakeholders in the academic community to ensure that they are responsibly using AI-powered laptops in academics and related applications.
